This turbo charger consists basically of a centrifugal compressor mounted on a common shaft with a double flow turbine driven by exhaust gas from the engine.

The turbo charger is capable of supplying far more air to the engine than for a non-supercharged engine, which is without such a charger.

In applications where the boost pressure is relatively low, the turbo charger is capable of reducing the smoke

concentration, the concentration in the cylinder, fuel consumption, and deterioration in performance at elevated terrain by increasing the amount of air to the engine.

In applications where the boost pressure is high, the charger is capable of providing a large increase in engine output by increasing the amount of air into the engine, in addition to the above mentioned advantages.
