

Abstract: The purpose of this study was to determine the effect of a 12-week training program on the physical fitness and health-related quality of life (HRQL) of sedentary middle-aged women. The study was a randomized controlled trial. The participants were divided into two groups: a control group and an exercise group. The exercise group performed a 12-week training program consisting of aerobic and strength training. The control group did not exercise. The primary outcome was the change in HRQL, measured using the SF-36 questionnaire. The secondary outcome was the change in physical fitness, measured using a 6-minute walk test. The results showed that the exercise group had a significant improvement in HRQL and physical fitness compared to the control group. The findings suggest that a 12-week training program can improve the physical fitness and HRQL of sedentary middle-aged women.
