Helicopter Fuel Burn Modeling in Aedt U.s. Department of Transportation, 2013-12 As students of the faculty of Aerospace Engineering at the Technical University of Delft The Netherlands it is mandatory to do an internship in the first or second year of the Masters track The total duration of the internship is set to a minimum of 3 months and is rewarded upon completion with 18 ECTS The goal of the internship is to put the knowledge gained at the Technical University of Delft into a practical use being either the aviation or the space field and to familiarize students with working for a company in preparation of their professional life There are numerous options available but working for the Volpe center in the United States of America is an opportunity not to be missed

Helicopter Fuel Burn Modeling in AEDT* Alexander Haagsma, Elgar Van Veggel, 2011 This report documents work done to enhance helicopter fuel consumption modeling in the Federal Aviation Administration's Aviation Environmental Design Tool AEDT Fuel consumption and flight performance data were collected from helicopter flight manuals and from in service operations These data were used to develop methods for predicting helicopter fuel consumption as a function of the helicopter flight state The primary method developed for this report showed a difference from flight manual reported fuel consumption of about 4% in cruise mode for the utilized helicopter weight Technical report documentation page

Understanding the Airport's Role in Performance-based Navigation Sebastian D. Timar, Robb Varani, Robert Hemm, Brian Townsend, Mark Ricketson, Wayne MacKenzie, William J. Dunlay, Grafton Technologies, Inc, 2016 TRB's Airport Cooperative Research Program ACRP Report 150 NextGen for Airports Volume I Understanding the Airport's Role in Performance Based Navigation Resource Guide the first report in this series provides comprehensive information to practitioners concerning all aspects of Performance Based Navigation PBN and how implementation affects overall airport operations This Resource Guide encompasses background information description of effects on short and long term airport development impacts on safety and performance measures and other critical factors affecting future airport operations In addition to providing guidance to users on available resources for additional assistance this volume also includes lessons learned and best practices based on findings from case studies that examined the airport operator's role in PBN implementation The Next Generation Air Transportation System NextGen refers to the federal programs predominately airspace air traffic or avionics related that are designed to modernize the National Airspace System NAS ACRP's NextGen initiative aims to inform airport operators about some of these programs and how the enabling practices data and technologies resulting from them will affect airports and change how they operate Publisher

Rotorcraft Performance Model (RPM) for Use in AEDT David A. Senzig, Eric R. Boeker, John A. Volpe National Transportation Systems Center (U.S.), 2015 Abstract This report documents a rotorcraft performance model for use in the FAA's Aviation Environmental Design Tool The new rotorcraft performance model is physics based This new model replaces the existing helicopter trajectory modeling methods in the Aviation Environmental Design Tool which were mode based The new methods enable fuel consumption and emissions modeling based on the performance data derived from information found in the helicopters flight manuals

Statistical Modeling of Aircraft Engine Fuel Burn Yashovardhan Sushil Chati, 2018 Fuel burn is a key driver of aircraft performance and contributes to airline costs and aviation emissions While the trajectory ground track of a flight can be observed using surveillance systems its fuel consumption is generally not disseminated by the operating airline Emissions inventories and benefits assessment tools therefore need models that can predict the fuel flow rate profile and fuel burn of a flight given its trajectory data Most existing fuel burn estimation tools rely on an architecture that is centered around the Base of Aircraft Data BADA an aircraft performance model developed by EUROCONTROL Operational data including trajectory data are generally processed in order to generate the inputs needed by BADA which then provides an estimate of the fuel flow rate and fuel burn Although a versatile tool that covers a large number of aircraft types BADA makes several assumptions that are not representative of real world operations Consequently the reliance on BADA results in errors in the fuel burn estimates Additionally existing fuel burn modeling tools provide deterministic predictions thereby not capturing the operational variability seen in practice This thesis proposes an alternative model architecture that enables the development of data driven statistical models of fuel burn The parameters of interest are the instantaneous fuel flow rate that is the mass of fuel consumed per unit time and the fuel burn cumulative mass of fuel consumed over a particular phase or the entire trajectory The new model architecture uses supervised learning algorithms to directly map aircraft trajectory variables to the fuel flow rate and subsequently fuel burn The models are trained and validated using operational data from flight recorders and therefore reflect real world operations A physical understanding of aircraft and engine performance is leveraged for feature selection An important characteristic of statistical methods is that they provide both estimates of mean values as well as predictive distributions reflecting the variability and uncertainty Locally expert models are developed for each aircraft type and for each of the flight phases The Bayesian technique of Gaussian Process Regression GPR is found to be well suited for modeling fuel burn The resulting models are found to be significantly better than state of the art aircraft performance models

in predicting the fuel flow rate and fuel burn of a trajectory giving up to a 63% improvement in total airborne fuel burn prediction over the BADA model Finally the Takeoff Weight TOW of an aircraft is recognized as an important variable for determining the fuel burn The thesis therefore develops and evaluates a methodology to estimate the TOW of a flight using trajectory data from its takeoff ground roll The proposed statistical models are found to result in up to a 76% smaller error than the Aircraft Noise and Performance ANP database which is used currently for TOW estimation

Development of Aircraft Fuel Burn Modeling Techniques with Applications to Global Emissions Modeling and Assessment of the Benefits of Reduced Vertical Separation Minimums Tim Alan Yoder, 2007 Cont It was found the introduction of dynamic weather contributed greatly to the accuracy of SAGE given that the system wide average true airspeed error is 10% when the assumption of zero winds is used Finally this improved model was used to quantify the benefits of implementing Reduced Vertical Separation Minimums RVSM in US airspace in January of 2005 This was accomplished through a comparison of system wide efficiency during representative time periods prior to and following RVSM implementation The results of this analysis provide insight into not only the benefits of RVSM but also the effects of these model improvements and the efficacy of the different efficiency metrics used It was found that RVSM resulted in an increase in fuel efficiency nm kg of 1 81% 0 55% and an increase in NOx efficiency nm kg of 3 14% 1 25% An additional control comparison was made during these same time periods of system efficiency over the North Atlantic and Western Europe where RVSM had been implemented several years prior Using an efficiency metric which normalized for the difference in winds between the two periods it was found that there was indeed no benefit seen in this control study providing support for the US Domestic RVSM results

A Quasi-Dimensional SI Burn Rate Model for Carbon-Neutral Fuels Sebastian Hann, 2021 Sebastian Hann describes the development of a quasi dimensional burn rate model that enables the prediction of a fuel variation without the need for a recalibration of the model The model is valid for spark ignition combustion engines powered by conventional and carbon neutral fuels Its high predictive ability was achieved by modeling the fuel dependent laminar flame speed based on reaction kinetics calculations In addition the author discards a fuel influence on flame wrinkling by performing an engine measurement data analysis He investigates the fuel influence on engine knock and models it via ignition delay times obtained from reaction kinetics calculations Contents Fuel Influence on Flame Wrinkling Laminar Flame Speed Model Burn Rate Model Improvement Engine Knock Investigation and Modeling

Target Groups Scientists and students in the field of automotive engineering esp thermodynamics and 0D 1D engine simulation Calculation and development engineers in industry working in the field of thermodynamics esp combustion engine development About the Author Sebastian Hann works as a research assistant in the field of 0D 1D simulation at the Institute of Automotive Engineering University of Stuttgart He dealt with the investigation and modeling of the fuel influence on spark ignition engine combustion and engine knock In addition to conventional fuels he also considered carbon neutral fuels
