Can Statistical Capacity Building Help Reduce Procyclical Fiscal Policy in Developing Countries? Mr.Sampawende J Tapsoba,Mr.Robert C York,Neree C.G.M. Noumon,2016-11-15 Few papers have attempted to assess the role of capacity especially in the area of macroeconomic statistics Consequently we make an attempt to advance this literature through the construction of a statistical capacity building index and then test its explanatory power on the cyclicity of government spending Using panel data from 62 developing countries we find evidence that improvements in this index are associated with less procyclicality of government spending over the period 1990 2012 with the significance of this relationship dependent upon the quality of administrative and technical capacity of budgetary institutions

Not All Energy Transitions Are Alike: Disentangling the Effects of Demand and Supply-Side Policies on Future Oil Prices Lukas Boer,Mr. Andrea Pescatori,Martin Stuermer,2023-08-04 We use structural scenario analysis to show that the climate policy mix supply side versus demand side policies can lead to different oil price paths with diverging distributional consequences in a netzero emissions scenario When emission reduction is driven by demand side policies prices would decline to around 25 USD per barrel in 2030 benefiting consuming countries Vice versa supply side climate policies aimed at curbing oil production would push up prices to above 130 USD per barrel benefiting those producing countries that take the

political decision to keep on producing. Consequently, it is wrong to assume that oil prices will necessarily decline due to the clean energy transition. As policies are mostly formulated at the country level and hard to predict at the global level, the transition will raise uncertainty about the price outlook.
