Computer Hardware Description Languages and Their Applications John A. Darringer, F. J. Rammig, 1990

Languages for precisely describing the behavior of computers have been studied since the conception of the computer itself. As the computer industry has grown so has the need to exchange information about computers. Computer Hardware Description Languages CHDL are required to provide specifications and detailed implementation for a growing menu of sophisticated design automation tools including synthesis verification simulation analysis optimization placement wiring and testing. Communicate requirements and capabilities between suppliers and users of computer components and subsystems facilitate the transfer of new methods and results within the university and industrial research community. As reflected in this book there is an increased emphasis on applications and resulting requirements that are placed on CHDLs. In the field of synthesis a major application area there is today a focus on high level synthesis and synthesis under design constraints. In the area of design correctness research has shifted away from simulation to formal verification techniques such as temporal logic.

Functional Programming Languages and Computer Architecture John Hughes, 1991-08-07 This book offers a comprehensive view of the best and the latest work in functional programming. It is the proceedings of a major international conference and contains 30 papers selected from 126 submitted. A number of themes emerge. One is a growing interest in types: powerful type systems or type checkers supporting overloading coercion dynamic types and incremental inference linear types to optimize storage and polymorphic types to optimize semantic analysis. The hot topic of partial evaluation is well represented: techniques for higher order binding time analysis assuring termination of partial evaluation and improving the residual programs. A partial evaluator generates the thorny problem of manipulating state in functional languages is addressed: one paper even argues that parallel programs with side effects can be more declarative than purely functional ones. Theoretical work covers a new model of types based on projections parametricity a connection between strictness analysis and logic and a discussion of efficient implementations of the lambda calculus. The connection with computer architecture and a variety of other topics are also addressed.
