**Eastern European Mathematics Education in the Decades of Change** Alexander Karp, 2020-05-04 This contributed volume is devoted to the recent history and evolution of mathematics education in Eastern Europe exploring how it was influenced by social and political changes in this part of the world Despite the broad recognition of the importance of these changes little scholarship exists that examines the ways in which they were followed by changes in the teaching of mathematics in the post socialist countries Indeed the analyzed processes are complex and vary across the states Accordingly this book touches on many factors including differences in cultures and traditions that find expression in the teaching of mathematics Specifically this volume seeks to explore what changes there were in education in general and in the position of mathematics in school education in these years and how these changes may be explained and documented what changes there were in the content of mathematics education and its assessment and how were they motivated and adopted what new textbooks appeared and what new methodological ideas were offered in them how and why mathematics teacher education and or professional development changed what was the role if any of foreign influences on mathematics education etc The book will be of interest to both researchers in mathematics education and practitioners teachers as well as a broader audience of historians and educators exploring the political aspects of education

**Mathesis Universalis, Computability and Proof** Stefania Centrone, Sara Negri, Deniz Sarikaya, Peter M.

Schuster, 2019-10-25 In a fragment entitled *Elementa Nova Matheseos Universalis* 1683 Leibniz writes the mathesis shall deliver the method through which things that are conceivable can be exactly determined in another fragment he takes the mathesis to be the science of all things that are conceivable Leibniz considers all mathematical disciplines as branches of the mathesis and conceives the mathesis as a general science of forms applicable not only to magnitudes but to every object that exists in our imagination i.e. that is possible at least in principle As a general science of forms the mathesis investigates possible relations between arbitrary objects *objets quelconques* It is an abstract theory of combinations and relations among objects whatsoever In 1810 the mathematician and philosopher Bernard Bolzano published a booklet entitled *Contributions to a Better Grounded Presentation of Mathematics* There is according to him a certain objective connection among the truths that are germane to a certain homogeneous field of objects some truths are the reasons *Gründe* of others and the latter are consequences *Folgen* of the former The reason consequence relation seems to be the counterpart of causality at the level of a relation between true propositions Arigorous proof is characterized in this context as a proof that shows the reason of the proposition that is to be proven Requirements imposed on rigorous proofs seem to anticipate normalization results in current proof theory The contributors of *Mathesis Universalis Computability and Proof* leading experts in the fields of computer science mathematics logic and philosophy show the evolution of these and related ideas exploring topics in proof theory computability theory intuitionistic logic constructivism and reverse mathematics delving deeply into a contextual examination of the relationship between mathematical rigor and demands for simplification

Unified Theory for Fractional and Entire Differential Operators Arnaud Rougirel,2024-06-27 This monograph proposes a unified theory of the calculus of fractional and standard derivatives by means of an abstract operator theoretic approach By highlighting the axiomatic properties shared by standard derivatives Riemann Liouville and Caputo derivatives the author introduces two new classes of objects The first class concerns differential triplets and differential quadruplets the second concerns boundary restriction operators Instances of boundary restriction operators can be generalized fractional differential operators supplemented with homogeneous boundary conditions The analysis of these operators comprises The computation of adjoint operators The definition of abstract boundary values The solvability of equations supplemented with inhomogeneous abstract linear boundary conditions The analysis of fractional inhomogeneous Dirichlet Problems As a result of this approach two striking consequences are highlighted Riemann Liouville and Caputo operators appear to differ only by their boundary conditions and the boundary values of functions in the domain of fractional operators are closely related to their kernel Unified Theory for Fractional and Entire Differential Operators will appeal to researchers in analysis and those who work with fractional derivatives It is mostly self contained covering the necessary background in functional analysis and fractional calculus

*Pattern Recognition on Oriented Matroids* Andrey O. Matveev,2017-09-11 Pattern Recognition on Oriented Matroids covers a range of innovative problems in combinatorics poset and graph theories optimization and number theory that constitute a far reaching extension of the arsenal of committee methods in pattern recognition The groundwork for the modern committee theory was laid in the mid 1960s when it was shown that the familiar notion of solution to a feasible system of linear inequalities has ingenious analogues which can serve as collective solutions to infeasible systems A hierarchy of dialects in the language of mathematics for instance open cones in the context of linear inequality systems regions of hyperplane arrangements and maximal covectors or toposes of oriented matroids provides an excellent opportunity to take a fresh look at the infeasible system of homogeneous strict linear inequalities the standard working model for the contradictory two class pattern recognition problem in its geometric setting The universal language of oriented matroid theory considerably simplifies a structural and enumerative analysis of applied aspects of the infeasibility phenomenon The present book is devoted to several selected topics in the emerging theory of pattern recognition on oriented matroids the questions of existence and applicability of matroidal generalizations of committee decision rules and related graph theoretic constructions to oriented matroids with very weak restrictions on their structural properties a study in which in particular interesting subsequences of

the Farey sequence appear naturally of the hierarchy of the corresponding tope committees a description of the three tope committees that are the most attractive approximation to the notion of solution to an infeasible system of linear constraints an application of convexity in oriented matroids as well as blocker constructions in combinatorial optimization and in poset theory to enumerative problems on tope committees an attempt to clarify how elementary changes one element reorientations in an oriented matroid affect the family of its tope committees a discrete Fourier analysis of the important family of critical tope committees through rank and distance relations in the tope poset and the tope graph the characterization of a key combinatorial role played by the symmetric cycles in hypercube graphs Contents Oriented Matroids the Pattern Recognition Problem and Tope Committees Boolean Intervals Dehn Sommerville Type Relations Farey Subsequences Blocking Sets of Set Families and Absolute Blocking Constructions in Posets Committees of Set Families and Relative Blocking Constructions in Posets Layers of Tope Committees Three Tope Committees Halfspaces Convex Sets and Tope Committees Tope Committees and Reorientations of Oriented Matroids Topes and Critical Committees Critical Committees and Distance Signals Symmetric Cycles in the Hypercube Graphs

*Differential Geometry of Curves and Surfaces* Victor Andreevich Toponogov, 2006-09-10 This concise guide to the differential geometry of curves and surfaces can be recommended to first year graduate students strong senior students and students specializing in geometry The material is given in two parallel streams The first stream contains the standard theoretical material on differential geometry of curves and surfaces It contains a small number of exercises and simple problems of a local nature It includes the whole of Chapter 1 except for the problems Sections 1.5.1, 7.1.10 and Section 1.11 about the phase length of a curve and the whole of Chapter 2 except for Section 2.6 about classes of surfaces Theorems 2.8.1, 2.8.4 the problems Sections 2.7.4, 2.8.3 and the appendix Section 2.9 The second stream contains more difficult and additional material and formulations of some complicated but important theorems for example a proof of A.D. Aleksandrov's comparison theorem about the angles of a triangle on a convex surface formulations of A.V. Pogorelov's theorem about rigidity of convex surfaces and S.N. Bernstein's theorem about saddle surfaces In the last case the formulations are discussed in detail A distinctive feature of the book is a large collection 80 to 90 of nonstandard and original problems that introduce the student into the real world of geometry

**Supersymmetry in Mathematics and Physics** Sergio Ferrara, Rita Fiorese, Veeravalli Seshadri Varadarajan, 2011-08-28 Supersymmetry was created by the physicists in the 1970s to give a unified treatment of fermions and bosons the basic constituents of matter Since then its mathematical structure has been recognized as that of a new development in geometry and mathematicians have busied themselves with exploring this aspect This volume collects recent advances in this field both from a physical and a mathematical point of view with an accent on a rigorous treatment of the various questions raised
