

CONDENSATE MECHANICS

Condensate forms in air conditioning systems and industrial processes and is a byproduct of various chemical reactions. Efficient removal of this condensate is crucial for maintaining system performance and preventing damage.

Condensate is typically collected in a reservoir or sump and then pumped out of the system. The pump must be capable of handling the volume of condensate and the height of the discharge. Proper pump selection and installation are essential for efficient condensate removal. Regular maintenance, including filter cleaning and pump inspection, is necessary to ensure optimal performance.

Water Removal System

This type of system is used to remove water from a process stream. It typically consists of a series of tanks and pipes that allow the water to be separated from the process stream.

- The water is then collected in a reservoir or sump and pumped out of the system. The pump must be capable of handling the volume of water and the height of the discharge.
