industrialization is particularly significant today with the predominance and quick growth rate of the world's urban population. Ongoing urbanization is creating new perspectives on forestry, inducing changes in its social representation and changing lifestyles and practices with a tendency toward dematerialization. The process of urbanization is also creating a disconnect and in some ways is leaving behind rurality, the sector of society where forestry has traditionally developed and taken place over centuries. The second issue covered in this book is the tertiarization of the economy. In society today the sector of services largely dominates the economy and occupies the major part of the world's active population. This ongoing process modifies professional modalities and ways of life and opens new doors to forests through the immaterial goods they provide. It also profoundly changes the framework, rules, processes, means of production, exchanges between economic factors and the processes of innovation. The third issue is undoubtedly globalization in its economic, political, and social components. Whether it's through bridging distances, crossing borders, accelerating changes, standardizing practices, leveling hierarchical structures, or pushing for interdependence, globalization impacts everyone everywhere in multiple ways. Forestry is no exception. *Forestry in the Midst of Global Changes* focuses on these global drivers of change from the perspective of their relationships with how society functions. By analyzing them in depth through multidisciplinary, interdisciplinary, and even transdisciplinary approaches, this book is helping to design the forestry of tomorrow. **Catalog of Copyright Entries.**

Ocampo-Martinez, Rudy R. Negenborn, 2015-06-03. This book aims at stimulating discussion between researchers working on state of the art approaches for operational control and design of transport of water on the one hand and researchers working on state of the art approaches for transport over water on the other hand. The main contribution of the book as a whole is to present novel perspectives ultimately leading to the management of an envisioned unified management framework taking the recent advances from both worlds as a baseline. The book is intended to be a reference for control oriented engineers who manage water systems with either or both purposes in mind: transport of water, transport of goods over water. It highlights the possible twofold nature of water projects where water either acts as primary object of study or as a means. The book is dedicated to comparing and relating to one another different strategies for operational management and control of different but strongly related systems in the framework of the water. In that sense the book presents different approaches treating both the transport of water and transport over water. It compares the different approaches within the same field, highlighting their distinguishing features and advantages according to selected qualitative indices and demonstrates the interaction and cross relations between both fields. It will also help to determine the gaps and common points for both fields towards the design of such a unifying framework which is lacking in the literature. Additionally, the book looks at case studies where the design of modeling control strategies of either transport of water or transport over water have been proposed, discussed, or
