The developments within the computationally and numerically oriented areas of Operations Research Finance Statistics and Economics have been significant over the past few decades Each area has been developing its own computer systems and languages that suit its needs but there is relatively little cross fertilization among them yet This volume contains a collection of papers that each highlights a particular system language model or paradigm from one of the computational disciplines aimed at researchers and practitioners from the other fields The 15 papers cover a number of relevant topics Models and Modelling in Operations Research and Economics novel High level and Object Oriented approaches to programming through advanced uses of Maple and MATLAB and applications and solution of Differential Equations in Finance It is hoped that the material in this volume will whet the reader's appetite for discovering and exploring new approaches to old problems and in the longer run facilitate cross fertilization among the fields We would like to thank the contributing authors the reviewers the publisher and last but not least Jesper Saxtorph Anders Nielsen and Thomas Stidsen for invaluable technical assistance

The Finite Element Method Darrell W. Pepper, Juan C. Heinrich, 2005-10-31 This much anticipated second edition introduces the fundamentals of the finite element method featuring clear cut examples and an applications oriented approach Using the transport equation for heat transfer as the foundation for the governing equations this new edition demonstrates the versatility of the method for a wide range of applications including structural analysis and fluid flow Much attention is given to the development of the discrete set of algebraic equations beginning with simple one dimensional problems that can be solved by inspection continuing to two and three dimensional elements and ending with three chapters describing applications The increased number of example problems per chapter helps build an understanding of the method to define and organize required initial and boundary condition data for specific problems In addition to exercises that can be worked out manually this new edition refers to user friendly computer codes for solving one two and three dimensional problems Among the first FEM textbooks to include finite element software the book contains a website with access to an even more comprehensive list of finite element software written in FEMLAB MAPLE MathCad MATLAB FORTRAN C and JAVA the most popular programming languages This textbook is valuable for senior level undergraduates in mechanical aeronautical electrical chemical and civil engineering Useful for short courses and home study learning the book can also serve as an introduction for first year graduate students new to finite element coursework and as a refresher for industry professionals The book is a perfect lead in to *Intermediate Finite Element Method Fluid Flow and Heat and Transfer Applications* Taylor Francis 1999 Hb 1560323094

Bifurcations in Continuous Piecewise Linear Differential Systems Enrique Ponce, Javier Ros, Elisabet Vela, 2022-12-10 The book is devoted to the qualitative study of differential equations defined by piecewise linear PWL vector fields mainly continuous and presenting two or three regions of linearity The study focuses on the more common bifurcations that PWL differential systems can undergo with emphasis on those leading to limit cycles Similarities and differences with respect to their smooth counterparts are considered and highlighted Regarding the dimensionality of the addressed problems some general results in arbitrary dimensions are included The manuscript mainly addresses specific aspects in PWL differential systems of dimensions 2 and 3 which are sufficient for the analysis of basic electronic oscillators The work is divided into three parts The first part motivates the study of PWL differential systems as the natural next step

towards dynamic complexity when starting from linear differential systems The nomenclature and some general results for PWL systems in arbitrary dimensions are introduced In particular a minimal representation of PWL systems called canonical form is presented as well as the closing equations which are fundamental tools for the subsequent study of periodic orbits The second part contains some results on PWL systems in dimension 2 both continuous and discontinuous and both with two or three regions of linearity In particular the focus center limit cycle bifurcation and the Hopf like bifurcation are completely described The results obtained are then applied to the study of different electronic devices In the third part several results on PWL differential systems in dimension 3 are presented In particular the focus center limit cycle bifurcation is studied in systems with two and three linear regions in the latter case with symmetry Finally the piecewise linear version of the Hopf pitchfork bifurcation is introduced The analysis also includes the study of degenerate situations Again the above results are applied to the study of different electronic oscillators
