Abstract.—The authors examined whether the type of information collected during a search for a target stimulus (i.e., whether the target was present or absent) influenced the type of information that was collected. In two experiments, participants were asked to find a target stimulus in a set of stimuli. In Experiment 1, participants were asked to find a target stimulus in a set of stimuli. In Experiment 2, participants were asked to find a target stimulus in a set of stimuli. The results of both experiments showed that participants collected more information when the target was present than when the target was absent. This finding has implications for the design of search tasks and for the interpretation of search results.
