High Power Lasers In Production Engineering
 Dieter Schuocker, 1999-03-03 High power lasers of either the gas or solid state type can be used to generate a focal spot with a diameter of about a tenth of a millimetre and a power density of up to 100 Mio W cm² With these intensities all materials can be heated up rapidly leading to fast melting violent evaporation or even plasma formation So laser beams can be utilized for various processing tasks such as transformation hardening cutting and ablation or welding and cladding or even rapid prototyping With these processes important advantages are achieved compared to conventional tools such as high processing speed due to the high concentration of energy and high quality of the processed workpiece without deformations due to the small overall heat input to the workpiece that corresponds to the small spot diameter All these advantages finally result in strongly reduced production costs which is the main reason for a world wide substitution of conventional processes and other beam tools by laser technology This monograph offers a great insight into the operation principles of high power laser sources the phenomena of interaction of laser beams and materials and the mechanisms of the various production processes with lasers thus enabling production engineers and others to make optimum use of the benefits of laser technology and to understand the technical properties and the physical limitations of this most recent technology especially in comparison to conventional tools and other beam tools and providing a sufficient basis for the understanding and use of future developments in this area

Handbook of Laser Technology and Applications Colin. E. Webb, 2020-09-29 The invention of the laser was one of the towering achievements of the twentieth century At the opening of the twenty first century we are witnessing the burgeoning of the myriad technical innovations to which that invention has led The Handbook of Laser Technology and Applications is a practical and long lasting reference source for scientists and engineers who work with lasers The Handbook provides a comprehensive guide to the current status of lasers and laser systems it is accessible to science or engineering graduates needing no more than standard undergraduate knowledge of optics Whilst being a self contained reference work the Handbook provides extensive references to contemporary work and is a basis for studying the professional journal literature on the subject It covers applications through detailed case studies and is therefore well suited to readers who wish to use it to solve specific problems of their own The first of the three volumes comprises an introduction to the basic scientific principles of lasers laser beams and non linear optics The second volume describes the mechanisms and operating characteristics of specific types of

laser including crystalline solid state lasers semiconductor diode lasers fibre lasers gas lasers chemical lasers dye lasers and many others as well as detailing the optical and electronic components which tailor the laser's performance and beam delivery systems The third volume is devoted to case studies of applications in a wide range of subjects including materials processing optical measurement techniques medicine telecommunications data storage spectroscopy earth sciences and astronomy and plasma fusion research This vast compendium of knowledge on laser science and technology is the work of over 130 international experts many of whom are recognised as the world leaders in their respective fields Whether the reader is engaged in the science technology industrial or medical applications of lasers or is researching the subject as a manager or investor in technical enterprises they cannot fail to be informed and enlightened by the wide range of information the Handbook supplies

principle the focusability and absorptivity 2 the polarisation having considerable influence on the absorptivity for large angles of incidence 3 the power P which together with the achievable spot diameter d L f determines the intensity in the interaction zone 4
