Science SOL 5.2- Plants & Animals

Diagram: Plants and animals have different processes and structures that allow them to survive and reproduce in an environment.

Plants are composed of parts that perform specialized functions. All processes require energy from the sun.

Plant Structure:

- Root:** Anchor the plant into the soil and absorb water and nutrients.
- Stem:** Support the plant and transport water and nutrients.
- Leaf:** Perform photosynthesis and transpiration.
- Flower:** Reproduce the plant.
- Fruit:** Protect the seeds and help them spread.

Photosynthesis:

Plants use energy from the sun to produce food. The process of photosynthesis takes in the green pigment, chlorophyll, and water and carbon dioxide to produce food and oxygen. The food is the energy that plants use to grow and reproduce. Oxygen is released into the atmosphere.

Respiration:

Plants use energy from the sun to produce food. The process of respiration takes in the food and oxygen to produce energy. The energy is used to grow and reproduce.

Plant Reproduction:

Plants have two main ways to reproduce: sexually and asexually. Sexually, a plant produces a flower that has male and female parts. The male part is the stamen, which produces pollen. The female part is the pistil, which receives the pollen. The pollen travels down the pistil to the ovary, where it fertilizes the egg. This process produces a seed. The seed grows into a new plant.

Asexual Reproduction:

Plants can also reproduce asexually. This means that a new plant can grow from a single parent plant. This can happen in several ways, such as by cutting a piece of a plant and putting it in the soil, or by a plant growing a new plant from its roots.
