HEATH, 2020 *Aristarchus of Samos, the Ancient Copernicus* Thomas Heath, 2013 **Encounters with Euclid** Benjamin Wardhaugh, 2023-11-14 A sweeping cultural history of one of the most influential mathematical books ever written Euclid's Elements of Geometry is one of the fountainheads of mathematics and of culture Written around 300 BCE it has traveled widely across the centuries generating countless new ideas and inspiring such figures as Isaac Newton Bertrand Russell Abraham Lincoln and Albert Einstein Encounters with Euclid tells the story of this incomparable mathematical masterpiece taking readers from its origins in the ancient world to its continuing influence today In this lively and informative book Benjamin Wardhaugh explains how Euclid's text journeyed from antiquity to the Renaissance introducing some of the many readers copyists and editors who left their mark on the Elements before handing it on He shows how some read the book as a work of philosophy while others viewed it as a practical guide to life He examines the many different contexts in which Euclid's book and his geometry were put to use from the Neoplatonic school at Athens and the artisans studios of medieval Baghdad to the Jesuit mission in China and the workshops of Restoration London Wardhaugh shows how the Elements inspired ideas in theology art and music and how the book has acquired new relevance to the strange geometries of dark matter and curved space Encounters with Euclid traces the life and afterlives of one of the most remarkable works of mathematics ever written revealing its lasting role in the timeless search for order and reason in an unruly world **The Copernicus of Antiquity** Thomas Heath, 2018-01-16 Sir Thomas Heath has given us under the title of The Copernicus of Antiquity an account of Aristarchus of Samos following a survey of the earlier Greek astronomers With the Greeks astronomy and geometry advanced pari passu during a period of three centuries until by the time of Aristarchus in the third century B C there was large knowledge of the elements plane and

solid of geometry of conic sections and of measurements of areas of curves and the surfaces and volumes of curved surfaces by geometrical methods practically anticipating the integral calculus The movement in astronomical knowledge was not less remarkable from the days of Thales of Miletus in the sixth century Anaxagoras showed that the moonlight is sunlight Pythagoras announced the sphericity of the earth Oenopides of Chios proved the obliquity of the elliptic while Aristarchus put forward as Copernicus himself admits the heliocentric hypothesis This little book might well be used in schools as a step towards making clear the largeness of Greek humanism The Contemporary Review Volume 120

Historiography of Mathematics in the 19th and 20th Centuries Volker R. Remmert, Martina R. Schneider, Henrik Kragh Sørensen, 2016-12-08 This book addresses the historiography of mathematics as it was practiced during the 19th and 20th centuries by paying special attention to the cultural contexts in which the history of mathematics was written In the 19th century the history of mathematics was recorded by a diverse range of people trained in various fields and driven by different motivations and aims These backgrounds often shaped not only their writing on the history of mathematics but in some instances were also influential in their subsequent reception During the period from roughly 1880-1940 mathematics

modernized in important ways with regard to its content its conditions for cultivation and its identity and the writing of the history of mathematics played into the last part in particular Parallel to the modernization of mathematics the history of mathematics gradually evolved into a field of research with its own journals societies and academic positions Reflecting both a new professional identity and changes in its primary audience various shifts of perspective in the way the history of mathematics was and is written can still be observed to this day Initially concentrating on major internal universal developments in certain sub disciplines of mathematics the field gradually gravitated towards a focus on contexts of knowledge production involving individuals local practices problems communities and networks The goal of this book is to link these disciplinary and methodological changes in the history of mathematics to the broader cultural contexts of its practitioners namely the historians of mathematics during the period in question

Aristarchus of Samos the Ancient Copernicus Thomas Heath, Sir, 2017-11-16 ARISTARCHUS who flourished in the first half of the third century B C is chiefly known as the only philosopher or astronomer of antiquity who taught that the earth moves round the sun This doctrine is however not mentioned in the only writing of his which has been preserved and the little we know about it is derived from allusions to it made by subsequent writers All the same his little book On the Sizes and Distances of the Sun and Moon is of great importance and Sir Thomas Heath's new and critical edition accompanied by a translation commentary and notes is therefore a most welcome addition to the literature of astronomical history Considering that the idea of the earth being in the centre of the universe reigned undisturbed until less than four hundred years ago it is one of the most surprising facts in the history of astronomy that its motion round the sun should have been proposed more than 1700 years before the time of Copernicus and that it should only have been accepted by one single philosopher Seleukus as to whom it is not even certain that he went the whole way and did not merely accept the daily rotation of the earth The editor of this new edition of Aristarchus therefore thought it desirable to prepare a lengthy introduction to the work giving an account of the progress of astronomy in Greece from the time of Thales to and including that of Aristarchus Though this is not the first time that an English writer has dealt with this subject Sir Thomas Heath has done good work by preparing this introductory memoir which fills more than three hundred pages as he possesses special qualifications for writing the history of Greek science and there are various controversial matters which cannot be too much discussed provided it is done by writers who are as competent to do so as he is The author gives full references to the very copious literature on the subject indeed he even notices some statements which he might well have ignored such as the comically exaggerated picture drawn by Gomperz of how Demokritus seems to have anticipated out of his inner consciousness many modern discoveries The passages in the works of ancient writers from which our knowledge of early Greek astronomy is derived are always given at full length in translation which many readers who may not have access to the originals will find very convenient Nature Volume 91
