Kisaalita, 2010-06-22 Advances in genomics and combinatorial chemistry during the past two decades inspired innovative technologies and changes in the discovery and pre clinical development paradigm with the goal of accelerating the process of bringing therapeutic drugs to market Written by William Kisaalita one of the foremost experts in this field *3D Cell Based Biosensors in Drug Discovery Programs* Microtissue Engineering for High Throughput Screening provides the latest information from theory to practice on challenges and opportunities for incorporating 3D cell based biosensors or assays in drug discovery programs The book supplies a historical perspective and defines the problem 3D cultures can solve It also discusses how genomics and combinatorial chemistry have changed the way drug are discovered and presents data from the literature to underscore the less than desirable pharmaceutical industry performance under the new paradigm The author uses results from his lab and those of other investigators to show how 3D micro environments create cell culture models that more closely reflect normal in vivo like cell morphology and function He makes a case for validated biomarkers for three dimensionality in vitro and discusses the advantages and disadvantages of promising tools in the search of these biomarkers The book concludes with case studies of drugs that were abandoned late in the discovery process which would have been discarded early if tested with 3D cultures Dr Kisaalita presents evidence in support of embracing 3D cell based systems for widespread use in drug discovery programs He goes to the root of the issue establishing the 3D cell based biosensor physiological relevance by comparing 2D and 3D culture

from genomic to functional levels He then assembles the bioengineering principles behind successful 3D cell based biosensor systems Kisaalita also addresses the challenges and opportunities for incorporating 3D cell based biosensors or cultures in current discovery and pre clinical development programs This book makes the case for widespread adoption of 3D cell based systems rendering their 2D counterparts in the words of Dr Kisaalita quaint if not archaic in the near future

Dual-Mode Electro-photonic Silicon Biosensors José Juan

Colás,2017-07-18 This highly interdisciplinary thesis reports on two innovative photonic biosensors that combine multiple simultaneous measurements to provide unique insights into the activity and structure of surface immobilized biological molecules In addition it presents a new silicon photonic biosensor that exploits two cascaded resonant sensors to provide two independent measurements of a biological layer immobilized on the surface By combining these two measurements it is possible to unambiguously quantify the density and thickness of the molecular layer here the approach s ability to study molecular conformation and conformational changes in real time is demonstrated The electrophotonic biosensor integrates silicon photonics with electrochemistry into a single technology This multi modal biosensor provides a number of unique capabilities that extend the functionality of conventional silicon photonics For example by combining the complementary information revealed by simultaneous electrochemical and photonic measurements it is possible to provide unique insights into on surface electrochemical processes Furthermore the ability to create electrochemical reactions directly on the silicon surface provides a novel approach for engineering the chemical functionality of the photonic sensors The electrophotonic biosensor thus represents a critical advance towards the development of very high density photonic sensor arrays for multiplexed diagnostics
