that this can be linked to their difficulties in learning cognition and everyday life The latest challenge in the field concerns the trainability of WM If it is a construct central to our understanding of cognition in typical and atypical development then specific intervention to sustain WM performance might also promote changes in cognitive processes associated with WM The idea that WM can be modified is debated however partly because of the theoretical implications of this view and partly due to the generally contradictory results obtained so far In fact most studies converge in demonstrating specific effects of WM training i e improvements in the trained tasks but few transfer effects to allied cognitive processes are generally reported It is worth noting that any maintenance effects when investigated are even more meagre In addition a number of methodological concerns have been raised in relation to the use of 1 single tasks to assess the effects of a training program 2 WM tasks differing from those used in the training to assess the effects of WM training and 3 passive control groups These and other crucial issues have so far prevented any conclusions from being drawn on the efficacy of WM training Bearing in mind that the opportunity to train WM could have a huge impact in the educational and clinical settings it seems fundamentally important to shed more light on the limits and potential of this line of research The aim of the research discussed here is to generate new evidence on the feasibility of training WM in individuals with LD and ID There are several questions that could be raised in this field For a start can WM be trained in this population Are there some aspects of WM that can be trained more easily than others Can a WM training reduce the impact of LD and ID on learning outcomes and on everyday living What kind of training program is best suited to the promotion of such changes

Model-Free Prediction and Regression Dimitris N. Politis, 2015-11-13 The Model Free Prediction Principle expounded upon in this monograph is based on the simple notion of transforming a complex dataset to one that is easier to work with e g i i d or Gaussian As such it restores the emphasis on observable quantities i e current and future data as opposed to unobservable model parameters and estimates thereof and yields optimal predictors in diverse settings such as regression and time series Furthermore the Model Free Bootstrap takes us beyond point prediction in order to construct

frequentist prediction intervals without resort to unrealistic assumptions such as normality Prediction has been traditionally approached via a model based paradigm i.e. a) fit a model to the data at hand and b) use the fitted model to extrapolate/predict future data Due to both mathematical and computational constraints 20th century statistical practice focused mostly on parametric models Fortunately with the advent of widely accessible powerful computing in the late 1970s computer intensive methods such as the bootstrap and cross validation freed practitioners from the limitations of parametric models and paved the way towards the big data era of the 21st century Nonetheless there is a further step one may take i.e. going beyond even nonparametric models this is where the Model Free Prediction Principle is useful Interestingly being able to predict a response variable Y associated with a regressor variable X taking on any possible value seems to inadvertently also achieve the main goal of modeling i.e. trying to describe how Y depends on X Hence as prediction can be treated as a by-product of model fitting key estimation problems can be addressed as a by-product of being able to perform prediction In other words a practitioner can use Model Free Prediction ideas in order to additionally obtain point estimates and confidence intervals for relevant parameters leading to an alternative transformation based approach to statistical inference
