Handbook of Graphical Models Marloes Maathuis,Mathias Drton,Steffen Lauritzen,Martin Wainwright,2018-11-12 A graphical model is a statistical model that is represented by a graph The factorization properties underlying graphical models facilitate tractable computation with multivariate distributions making the models a valuable tool with a plethora of applications Furthermore directed graphical models allow intuitive causal interpretations and have become a cornerstone for causal inference While there exist a number of excellent books on graphical models the field has grown so much that individual authors can hardly cover its entire scope Moreover the field is interdisciplinary by nature Through chapters by leading researchers from different areas this handbook provides a broad and accessible overview of the state of the art Key features Contributions by leading researchers from a range of disciplines Structured in five parts covering foundations computational aspects statistical inference causal inference and applications Balanced coverage of concepts theory methods examples and applications Chapters can be read mostly independently while cross references highlight connections The handbook is targeted at a wide audience including graduate students applied researchers and experts in graphical models

Handbook of Approximate Bayesian Computation Scott A. Sisson,Yanan Fan,Mark Beaumont,2018-09-03 As the world becomes increasingly complex so do the statistical models required to analyse the challenging problems ahead For the very first time in a single volume the Handbook of Approximate Bayesian Computation ABC presents an extensive overview of the theory practice and application of ABC methods These simple but

powerful statistical techniques take Bayesian statistics beyond the need to specify overly simplified models to the setting where the model is defined only as a process that generates data. This process can be arbitrarily complex to the point where standard Bayesian techniques based on working with tractable likelihood functions would not be viable. ABC methods finesse the problem of model complexity within the Bayesian framework by exploiting modern computational power, thereby permitting approximate Bayesian analyses of models that would otherwise be impossible to implement. The Handbook of ABC provides illuminating insight into the world of Bayesian modelling for intractable models for both experts and newcomers alike. It is an essential reference book for anyone interested in learning about and implementing ABC techniques to analyse complex models in the modern world.

Handbook of Methods for Designing, Monitoring, and Analyzing

Dose-Finding Trials John O'Quigley, Alexia Iasonos, Björn Bornkamp, 2017-04-27. Handbook of Methods for Designing, Monitoring and Analyzing Dose Finding Trials gives a thorough presentation of state of the art methods for early phase clinical trials. The methodology of clinical trials has advanced greatly over the last 20 years and arguably nowhere greater than that of early phase studies. The need to accelerate drug development in a rapidly evolving context of targeted therapies, immunotherapy, combination treatments and complex group structures has provided the stimulus to these advances. Typically we deal with very small samples, sequential methods that need to be efficient while at the same time adhering to ethical principles due to the involvement of human subjects. Statistical inference is difficult since the standard techniques of maximum likelihood do not usually apply as a result of model misspecification and parameter estimates lying on the boundary of the parameter space. Bayesian methods play an important part in overcoming these difficulties but nonetheless require special consideration in this particular context. The purpose of this handbook is to provide an expanded summary of the field as it stands and also through discussion provide insights into the thinking of leaders in the field as to the potential developments of the years ahead. With this goal in mind we present: An introduction to the field for graduate students and novices; A basis for more established researchers from which to build; A collection of material for an advanced course in early phase clinical trials; A comprehensive guide to available methodology for practicing statisticians on the design and analysis of dose finding experiments; An extensive guide for the multiple comparison and modeling MCP Mod dose finding approach; adaptive two stage designs for dose finding as well as dose time response models and multiple testing in the context of confirmatory dose finding studies. John O'Quigley is a professor of mathematics and research director at the French National Institute for Health and Medical Research based at the Faculty of Mathematics, University Pierre and Marie Curie in Paris, France. He is author of Proportional Hazards Regression and has published extensively in the field of dose finding. Alexia Iasonos is an associate attending biostatistician at the Memorial Sloan Kettering Cancer Center in New York. She has over one hundred publications in the leading statistical and clinical journals on the methodology and design of early phase clinical trials. Dr Iasonos has wide experience in the actual implementation of model based early phase trials and has given courses in

scientific meetings internationally Björn Bornkamp is a statistical methodologist at Novartis in Basel Switzerland researching and implementing dose finding designs in Phase II clinical trials He is one of the co developers of the MCP Mod methodology for dose finding and main author of the DoseFinding R package He has published numerous papers on dose finding nonlinear models and Bayesian statistics and in 2013 won the Royal Statistical Society award for statistical excellence in the pharmaceutical industry

A Quantitative Portrait of Analytic Philosophy Eugenio Petrovich, 2024-04-16 This book offers an unprecedented quantitative portrait of analytic philosophy focusing on two seemingly marginal features of philosophical texts citations and acknowledgements in academic publications Originating from a little network of philosophers based in Oxford Cambridge and Vienna analytic philosophy has become during the Twentieth century a thriving philosophical community with thousands of members worldwide Leveraging the most advanced techniques from bibliometrics citations and acknowledgments are used in this book to shed light on both the epistemology and the sociology of this philosophical field illuminating the intellectual trajectory of analytic philosophy as well as the social characteristics of the analytic community Special attention is dedicated to the last forty years providing insights into a phase of analytic philosophy which is still understudied by historians of philosophy In the eight chapters of the book readers will find not only numerous quantitative investigations and technical explanations but also a robust theoretical framework and epistemological reflections on the strengths and limitations of quantitative methods for the study of philosophy With its strong interdisciplinary appeal this book will engage a wide range of scholars including historians of philosophy seeking new methodologies analytic philosophers interested in a new look at their discipline and scholars in digital humanities bibliometrics and quantitative studies of science who will find many innovative techniques for investigating disciplinary fields
