Models for Brain Tumour Growth Rym Jaroudi, 2018-06-04 We study the following well established model of reaction diffusion type for brain tumour growth This equation describes the change over time of the normalised tumour cell density u as a consequence of two biological phenomena proliferation and diffusion We discuss a mathematical method for the inverse problem of locating the brain tumour source origin based on the reaction diffusion model Our approach consists in recovering the initial spatial distribution of the tumour cells starting from a later state which can be given by a medical image We use the nonlinear Landweber regularization method to solve the inverse problem as a sequence of well posed forward problems We give full 3 dimensional simulations of the tumour in time on two types of data the 3d Shepp Logan phantom and an MRI T1 weighted brain scan from the Internet Brain Segmentation Repository IBSR These simulations are obtained using standard finite difference discretisation of the space and time derivatives generating a simplistic approach

that performs well We also give a variational formulation for the model to open the possibility of alternative derivations and modifications of the model Simulations with synthetic images show the accuracy of our approach for locating brain tumour sources

Mathematical Biology James Dickson Murray,2003

Mathematical Biology James D. Murray,2007-06-12 It has been over a decade since the release of the now classic original edition of Murray s Mathematical Biology Since then mathematical biology has grown at an astonishing rate and is well established as a distinct discipline Mathematical modeling is now being applied in every major discipline in the

biomedical sciences Though the field has become increasingly large and specialized this book remains important as a text that introduces some of the exciting problems that arise in biology and gives some indication of the wide spectrum of questions that modeling can address Due to the tremendous development in the field this book is being published in two volumes This first volume is an introduction to the field the mathematics mainly involves ordinary differential equations that are suitable for undergraduate and graduate courses at different levels For this new edition Murray is covering certain items in depth giving new applications such as modeling marital interactions and temperature dependence sex determination SIAM 2004 Murray's *Mathematical Biology* is a classic that belongs on the shelf of any serious student or researcher in the field Together the two volumes contain well over 1000 references a rich source of material together with an excellent index to help readers quickly find key words I recommend the new and expanded third edition to any serious young student interested in mathematical biology who already has a solid basis in applied mathematics

equilibria and analyzing the strategies that may lead to the victory of the aggressive population. Techniques typical of two dimensional dynamical systems are used such as asymptotic behaviors regulated by the Poincaré Bendixson Theorem. A New Lotka Volterra Model of Competition With Strategic Aggression will appeal to researchers and students studying population dynamics and dynamical systems particularly those interested in the cross section between mathematics and ecology.

Regularization Methods for Ill-Posed Optimal Control Problems Frank Pörner, 2018-10-04. Ill posed optimization problems appear in a wide range of mathematical applications and their numerical solution requires the use of appropriate regularization techniques. In order to understand these techniques a thorough analysis is inevitable. The main subject of this book are quadratic optimal control problems subject to elliptic linear or semi linear partial differential equations. Depending on the structure of the differential equation different regularization techniques are employed and their analysis leads to novel results such as rate of convergence estimates. Mathematics of Continuous and Discrete Dynamical Systems Abba B. Gumel, 2014-06-18. This volume contains the proceedings of the AMS Special Session on Nonstandard Finite Difference Discretizations and Nonlinear Oscillations in honor of Ronald Mickens's 70th birthday held January 9-10 2013 in San Diego, CA. Included are papers on design and analysis of discrete time and continuous time dynamical systems arising in the natural and engineering sciences in particular the design of robust nonstandard finite difference methods for solving continuous time ordinary and partial differential equation models the analytical and numerical study of models that undergo nonlinear oscillations as well as the design of deterministic and stochastic models for epidemiological and ecological processes. Some of the specific topics covered in the book include the analysis of deterministic and stochastic SIR type models the assessment of cost effectiveness of vaccination problems finite difference methods for oscillatory dynamical systems including the Schrödinger equation and Brusselator system the design of exact and elementary stable finite difference methods the study of a two patch model with Allee effects and disease modified fitness the study of the delay differential equation model with application to circadian rhythm and the application of some special functions in the solutions of some problems arising in the natural and engineering sciences. A notable feature of the book is the collection of some relevant open problems intended to help guide the direction of future research in the area.
