Mathematical Structures of Epidemic Systems Vincenzo Capasso,2008-08-06 The dynamics of infectious diseases

represents one of the oldest and richest areas of mathematical biology. From the classical work of Hamer 1906 and Ross 1911 to the state of more modern developments associated with Anderson and May, Dietz, Hethcote, Castillo-Chavez and others, the subject has grown dramatically both in volume and in importance. Given the pace of development, the subject has become more and more diverse and the need to provide a framework for organizing the diversity of mathematical approaches has become clear. Enzo Capasso, who has been a major contributor to the mathematical theory, has done that in the present volume, providing a system for organizing and analyzing a wide range of models depending on the structure of the interaction matrix. The first class, the quasi-monotone or positive feedback systems, can be analyzed effectively through the use of comparison theorems; that is, the theory of order-preserving dynamical systems. The second, the skew-symmetrizable systems, rely on Lyapunov methods. Capasso develops the general mathematical theory and considers a broad range of examples that can be treated within one or the other framework. In so doing, he has provided the first steps towards the unification of the subject and made an invaluable contribution to the *Lecture Notes in Biomathematics*. Simon A. Levin, Princeton, January 1993.

Author's Preface to Second Printing In the Preface to the First Printing of this volume I wrote Oxford Textbook of Global Public Health. Roger Detels, Martin Gulliford, Quarraisha Abdool Karim, Chorh Chuan Tan, 2017. Sixth edition of the hugely successful internationally recognised textbook on global public health and epidemiology, comprehensively covering the scope, methods and practice of the discipline. Ecological Time Series. Thomas M. Powell, John H. Steele, 2012-12-06. This book results from a summer school held at Cornell University in 1992. The participants were graduate students and postdoctoral researchers selected from a broad range of interests and backgrounds in ecological studies. The summer school was the second in a continuing series whose underlying aim and the aim of this volume is to bring together the different methods and concepts underpinning terrestrial, freshwater and marine ecology. The first volume in the series focused on patch dynamics in these three ecological sectors. Here we have endeavored to complement that volume by extending its comparative approach to the consideration of ecological time series. The types of data and the methods of collection are necessarily very different in these contrasting environments, yet the underlying concept and the technical problems of analysis have much in common. It proved to be of great interest and value to the summer school participants to see the differences and then work through to an appreciation of the generalizable concepts. We believe that such an approach must have value as well for a much larger audience and we have structured this volume to provide a comparable reading experience.

Dynamical Systems

Zeraoulia Elhadj, 2019-01-21. Chaos is the idea that a system will produce very different long-term behaviors when the initial conditions are perturbed only slightly. Chaos is used for novel time or energy-critical interdisciplinary applications. Examples include high-performance circuits and devices, liquid mixing, chemical reactions, biological systems, crisis management, secure information processing and critical decision making in politics, economics as well as military applications, etc. This book presents the latest investigations in the theory of chaotic systems and their dynamics. The book covers some theoretical

aspects of the subject arising in the study of both discrete and continuous time chaotic dynamical systems This book presents the state of the art of the more advanced studies of chaotic dynamical systems *Mathematical Approaches for Emerging and Reemerging Infectious Diseases: An Introduction* Carlos Castillo-Chavez, 2002-05-02 This book grew out of the discussions and presentations that began during the Workshop on Emerging and Reemerging Diseases May 17-21 1999 sponsored by the Institute for Mathematics and its Application IMA at the University of Minnesota with the support of NIH and NSF The workshop started with a two day tutorial session directed at ecologists epidemiologists immunologists mathematicians and scientists interested in the study of disease dynamics The core of this first volume Volume 125 covers tutorial and research contributions on the use of dynamical systems deterministic discrete delay PDEs and ODEs models and stochastic models in disease dynamics The volume includes the study of cancer HIV pertussis and tuberculosis Beginning graduate students in applied mathematics scientists in the natural social or health sciences or mathematicians who want to enter the fields of mathematical and theoretical epidemiology will find this book useful Mathematical Models for Communicable Diseases Fred Brauer, Carlos Castillo-Chavez, 2013-02-07 A self contained and comprehensive guide to the mathematical modeling of disease transmission appropriate for graduate students **Matrix Models for Population, Disease, and Evolutionary Dynamics** J.
