interacting particles systems The introductory first chapter gives some historical background presents the main ideas in a rather simple discrete setting and reveals the meaning of intermediate prediction to quantum mechanics In order to answer Schrödinger's question the book takes three distinct approaches dealt with in separate chapters transformation by means of a multiplicative functional projection by means of relative entropy and variation of a functional associated to pairs of non linear integral equations The book presumes a graduate level of knowledge in mathematics or physics and represents a relevant and demanding application of today's advanced probability theory

Epistemic Complexity and Knowledge Construction A. Carsetti, 2013-03-19

The volume as its first target aims at clarifying that peculiar entanglement of complexity causality meaning emergence and intentionality that characterises the unfolding of the natural forms of human cognition As is well known cognition is not only a self organising process It is also a co operative and coupled process If we consider the external environment as a complex multiple and stratified Source which interacts with the nervous system we can easily realise that the cognitive activities devoted to the intelligent search for the depth information living in the Source may determine the very change of the complexity conditions according to which the Source progressively expresses its wild action In this sense simulation models are not neutral or purely speculative the true cognition actually appears to be necessarily connected with successful forms of reading those forms in particular that permit a specific coherent unfolding of the deep information content of the Source

Therefore the simulation models if valid materialise as creative channels i.e. as autonomous functional systems as the very roots of a new possible development of the entire system represented by mind and its Reality. From a general point of view the objectivity of Reality is also proportionate to the autonomy reached by cognitive processes. In this sense at the level of cultural evolution reference procedures act as guide, mirror and canalisation with respect to primary information flows and involved selective forces; they offer themselves as the actual instruments for the constant renewal of the code for the invention and the actual articulation of an ever new incompressibility. From an effective point of view they appear as indissolubly linked to the successive definition of specific and innovative measures of the epistemic complexity. These measures cannot concern only statistical rarity (Shannon) or computational incompressibility (Kolmogorov, Chaitin); on the contrary they should also be able to take into account the coupled connection between the Source and the cognitive agent, the evolution of this connection as well as the successive constitution of meaning as symbolic form. Hence the possible and necessary definition of new axiomatic systems, new measure spaces, the real displaying of processes of continuous reorganisation at the semantic level. Indeed it is only through a complete first order reduction and a correlated non standard second order analysis that new incompressibility will actually manifest itself. Therefore the reference procedures appear to be related to a process of multiplication of minds as well as to a process of clarification of meanings which finally emerges as vision via principles.

Emerging Applications of Number Theory Dennis A. Hejhal, Joel Friedman, Martin C. Gutzwiller, Andrew M. Odlyzko, 2012-12-06. Most people tend to view number theory as the very paradigm of pure mathematics. With the advent of computers however number theory has been finding an increasing number of applications in practical settings such as in cryptography, random number generation, coding theory and even concert hall acoustics. Yet other applications are still emerging providing number theorists with some major new areas of opportunity. The 1996 IMA summer program on Emerging Applications of Number Theory was aimed at stimulating further work with some of these newest and most attractive applications. Concentration was on number theory's recent links with a wide phenomena in quantum mechanics more specifically quantum chaos and graph theory especially expander graphs and related spectral theory. This volume contains the contributed papers from that meeting and will be of interest to anyone intrigued by novel applications of modern number theoretical techniques.

Paladin, Angelo Vulpiani, 2012-12-06 At the present moment after the success of the renormalization group in providing a conceptual framework for studying second order phase transitions we have a nearly satisfactory understanding of the statistical mechanics of classical systems with a non random Hamiltonian The situation is completely different if we consider the theory of systems with a random Hamiltonian or of chaotic dynamical systems The two fields are connected in fact in the latter the effects of deterministic chaos can be modelled by an appropriate stochastic process Although many interesting results have been obtained in recent years and much progress has been made we still lack a satisfactory understanding of the extremely wide variety of phenomena which are present in these fields The study of disordered or chaotic systems is the new frontier where new ideas and techniques are being developed More interesting and deep results are expected to come in

future years The properties of random matrices and their products form a basic tool whose importance cannot be underestimated They play a role as important as Fourier transforms for differential equations This book is extremely interesting as far as it presents a unified approach for the main results which have been obtained in the study of random matrices It will become a reference book for people working in the subject The book is written by physicists uses the language of physics and I am sure that many physicists will read it with great pleasure

Nonlinearity in Living Systems: Theoretical and Practical Perspectives on Metrics of Physiological Signal Complexity Sladjana Spasić, Srdjan Kesić, 2019-06-28 The biological basis of physiological signals is incredibly complex While many types of research certainly appreciate molecular cellular and systems approach to unravel overall biological complexity in the recent decades the interest for mathematical and computational characterization of structural and functional basis underlying biological phenomena gain wide popularity among scientists Nowadays we witnessed wide range applications of nonlinear quantitative analysis that produced measures such as fractal dimension power law scaling Hurst exponent Lyapunov exponent approximate entropy sample entropy Lempel Ziv complexity as well as other metrics for predictions of onset and progression of many pathological conditions especially in the central nervous systems CNS In this Research Topic we seek to bring together the recent practical and theoretical advances in the development and application of nonlinear methods or narrower fractal based methods for characterizing the complex physiological systems at multiple levels of the organization We will discuss the use of various complexity measures and appropriate parameters for characterizing the variety of physiological

signals up to the systems level There are multiple aims in this topic The recent advancement in the application of nonlinear methods for both normal and pathological physiological conditions is the first The second aim is to emphasize the more recent successful attempt to apply these methods across animal species Finally a comprehensive understanding of advantages and disadvantages of each method especially between its mathematical assumptions and real world applicability can help to find out what is at stake regarding the above aims and to direct us toward the more fruitful application of nonlinear measures and statistics in physiology and biology in general
