EOC: Genetic Relationships

Terms to know:

Homozygous dominant: GG

Homozygous recessive: gg

Heterozygous: Gg

X-linked recessive:

Male: X^gY

Female: X^GX^G

X-linked dominant:

Male: X^GY

Female: X^GX^G or X^GX^g

If a genotype has at least one dominant allele (GG or Gg) it will result in the **dominant phenotype**.

Example: If grey for GG is dominant to white, then GG is grey, Gg is grey, gg is white

Searcher for sex-linked traits → require the chromosomes of the male and female + their genotype

Other words:

Germline mutation	Somatic mutation
mutation that occurs in a sex cell	mutation that occurs in a body cell
will affect the genetic code in all cells	it only affects the cells that are produced from the mutated cell by mitosis

Sex-linked inheritance	Autosomal inheritance
traits inherited from genes on sex chromosomes (X: female, Y: male)	traits inherited from genes on autosomes (unrelated to sex) chromosomes
will affect more of one sex than the other (e.g. color blindness affects males more)	both sexes have an equal chance of inheriting

Key:

A **pedigree** is like a family tree for traits

Remember:
shaded = affected, for the trait

Identify individuals using:
Generation II - Individual I II

We **do** know that the trait is recessive, because affected individuals have the recessive genotype.

Recessive trait skips a generation!

Perez-Bercoff, 2012-07-01 vi The word protein coined one and a half century ago from the 1TpOTE to a proteios of primary importance underlines the primary importance ascribed to proteins from the time they were described as biochemical entities But the unmatched complexity of the process involved in their biosynthesis was understandably overlooked Indeed protein biosynthesis was supposed to be nothing more than the reverse of protein degradation and the same enzymes known to split a protein into its constituent amino acids were thought to be able under adequate conditions to reconstitute the peptide bond This oversimplified view persisted for more than 50 years It was just in 1940 that Borsook and Dubnoff examined the thermodynamical aspects of the process and concluded that protein synthesis could not be the reverse of protein degradation such an uphill task being thermodynamically impossible The next quarter of a century witnessed the unravelling of the basic mechanisms of protein biosynthesis a predictable aftermath of the Copernican revolution in biology which followed such dramatic developments as the discovery of the nature of the genetic material the double helical structure of DNA and the determination of the genetic code Our present understanding of the sophisticated mechanisms of regulation and control is a relatively novel acquisition and recent studies have shed some light

into the structure and organization of the eukaryotic gene *The Biosynthesis of Proteins* H. Chantrenne, 1961
