

UNDERSTANDING Ingredient Interactions and Independence

A systems approach to food and beverage innovation will help you succeed in the fast-paced world of product development.

Old-school product development is a methodical approach to formulating, with problem-solving steps applied along the progression from bench-top prototype to commercialization. This is no longer viable in today's constantly evolving world of food and beverage, where consumers are always looking for something new, while at the same time expecting cleaner labels, a strong nutritional profile, trending flavors and formats, and the story about the

ingredients, where they come from and why they are there.

Ingredion has developed a food systems approach to the innovation process that taps into the company's deep understanding of ingredient functionality and the marketplace. These systems take the complexity out of the formulating process to help develop the right products and get them to market quickly.

It's time to collaborate with Ingredion Food Systems to make product innovation faster, smarter and more efficient. Read more to better understand why a systems approach to product development considers all the ingredients up front, and how they interact with each other, or not. Less is often more when taking a systems approach. This helps keep labels simple and may even save money.

Low-Calorie Foods and Food Ingredients R. Khan,2012-12-06 amounts can produce a deleterious effect on animals In an attempt to quantify this potential for toxicity and to give sufficient margin for safety JECFA has introduced an acceptable daily intake ADI level for food additives For example the ADI values granted for saccharin aspartame cyclamate acesulfame K and sucralose are 2 5 40 11 9 and 1 3 5 mg kg body weight per day respectively Chapter 2 on regulatory aspects of low calorie food elaborates these points The additives that are to be consumed in large amounts such as a fat replacement product like Olestra or a new bulking material like polydextrose present a more complex problem as far as the evaluation of their toxicity is concerned Normal safety testing of an additive such as a high intensity sweetener requires that the test animals are fed with a sufficiently high dosage in order to produce an effect and then on that basis an ADI value is calculated In cases like Olestra and polydex trose which are not normally present in diet or metabolised to dietary constituents such an approach will obviously not be applicable or of any use in calculating an ADI value Due to these factors the regulatory authorities have not yet been able to produce any guidelines for toxicity trials for additives that are to be taken in food in large quantities
