Handbook of Materials Modeling Sidney Yip, 2007-11-17 This Handbook contains a set of articles introducing the modeling and simulation of materials from the standpoint of basic methods and studies The intent is to provide a compendium that is foundational to an emerging eld of computational research a new discipline that may now be called Compu tional Materials This area has become suf ciently

diverse that any attempt to cover all the pertinent topics would be futile. Even with a limited scope the present undertaking has required the dedicated efforts of 13 Subject Editors to set the scope of nine chapters, solicit authors and collect the manuscripts. The contributors were asked to target students and non specialists as the primary audience to provide an accessible entry into the field and to offer references for further reading. With no precedents to follow the editors and authors were only guided by a common goal to produce a volume that would set a standard toward defining the broad community and stimulating its growth. The idea of a reference work on materials modeling surfaced in conversations with Peter Binfield then the Reference Works Editor at Kluwer Academic Publishers in the spring of 1999. The rationale at the time already seemed quite clear: the field of computational materials research was taking off, powerful computer capabilities were becoming increasingly available and many sectors of the scientific community were getting involved in the enterprise.

Neutrons and Related Gamma Ray Problems / Neutronen und Verwandte Gammastrahlprobleme Edoardo Amaldi, U. Fano, L. V. Spencer, M. J. Berger, 2012-12-06 661 tures such as occurs in stellar atmospheres and in thermonuclear processes will not be considered 1 Because photoelectric absorption predominates completely at low photon energies and penetration theory is elementary under these conditions attention is directed in this article to photon energies above 20 kev On the high energy side this article does not cover the cascade shower processes which are dealt 2 with in cosmic ray studies In this connection it is recalled that the cascade shower process which involves electrons and positrons besides X rays becomes predominant above 10 Mev in heavy elements and above 100 Mev in light ones Theories developed for the study of cascade showers in cosmic rays rely on assumptions about the probability of interactions with matter which are adequate only at energies of the order of 1 Gev or more Below this energy there is a gap in which penetration phenomena are qualitatively known and understood

but have not yet been calculated in detail A few detailed experimental studies which have been made at energies up to 300 Mev will be reviewed in this article

The SAGE Handbook of Quantitative Methods in Psychology Roger E Millsap, Alberto Maydeu-Olivares, 2009-08-05 I often wonder to myself whether the field needs another book handbook or encyclopedia on this topic In this case I think that the answer is truly yes The handbook is well focused on important issues in the field and the chapters are written by recognized authorities in their fields The book should appeal to anyone who wants an understanding of important topics that frequently go uncovered in graduate education in psychology David C Howell Professor Emeritus University of Vermont Quantitative psychology is arguably one of the oldest disciplines within the field of psychology and nearly all psychologists are exposed to quantitative psychology in some form While textbooks in statistics research methods and psychological measurement exist none offer a unified treatment of quantitative psychology The SAGE Handbook of Quantitative Methods in Psychology does just that Each chapter covers a methodological topic with equal attention paid to established theory and the challenges facing methodologists as they address new research questions using that particular methodology The reader will come away from each chapter with a greater understanding of the methodology being addressed as well as an understanding of the directions for future developments within that methodological area Drawing on a global scholarship the Handbook is divided into seven parts Part One Design and Inference addresses issues in the inference of causal relations from experimental and non experimental research along with

the design of true experiments and quasi experiments and the problem of missing data due to various influences such as attrition or non compliance Part Two Measurement Theory begins with a chapter on classical test theory followed by the common factor analysis model as a model for psychological measurement The models for continuous latent variables in item response theory are covered next followed by a chapter on discrete latent variable models as represented in latent class analysis Part Three Scaling Methods covers metric and non metric scaling methods as developed in multidimensional scaling followed by consideration of the scaling of discrete measures as found in dual scaling and correspondence analysis Models for preference data such as those found in random utility theory are covered next Part Four Data Analysis includes chapters on regression models categorical data analysis multilevel or hierarchical models resampling methods robust data analysis meta analysis Bayesian data analysis and cluster analysis Part Five Structural Equation Models addresses topics in general structural equation modeling nonlinear structural equation models mixture models and multilevel structural equation models Part Six Longitudinal Models covers the analysis of longitudinal data via mixed modeling time series analysis and event history analysis Part Seven Specialized Models covers specific topics including the analysis of neuro imaging data and functional data analysis
