#### OPPOSITE

It is important to gain consent before assisting the patient (see Section 1.2). The initial assessment should be completed by requesting as much of the patient as is necessary in the circumstances to facilitate full access to the examination. To obtain the patient's dignity, it is often better to undertake a supervised examination through the patient while awaiting a further examination in the privacy of the ambulance. Clinical observations, when with consent in place, will demonstrate themselves due to features or evidence of bleeding.

It also important to recognise the effect that the environment can have on the patient, particularly if it is cold, raining, noisy and wet. The provider should seek to minimise the effect of the environment on the patient, for example, by keeping the patient protected from the elements.

**Remember to repeat the primary survey regularly.**

The advice offered in this section relates to a multiple casualty situation but does not extend to involvement in a formal major incident declared by one or more of the emergency services.

The word 'fragile' is defined from the French verb 'to hurt'. The purpose of this is to provide the emergency services with the information to provide the best care of patients in a patient situation where the emergency medical resources are low.

#### VENTILATION SUPPORT (BAG-VALVE-MASK)

(Note: for providers, this is a two-man technique)

Effective cooperation of the rescuer by inspiration and removal of carbon dioxide by exhalation is only achieved through a good seal, rhythm and depth of breathing. By using a technique an airway seal is achieved between 12 and 20 litres per minute with sufficient volume to make the chest rise.

In some patients, lying on the ground, the rescuer does not often move it to the abdominal muscles that are doing the work. The adequacy of this form of breathing results in the further assessment by feeling for airflow from the mouth, or have used the insufflation volume (warning: respiratory insufflation volume)

When a patient fails to breathe, or is not breathing

at all this stage, it may be necessary to
