How are knockout mice made? - Answer start with a segment of DNA (that does not encode for the gene) that you want to replace with the gene of interest. Use a blastocyst, take a fetus cell, using electroporation the DNA is incorporated. Recombination occurs and the segment of DNA swap with the gene of interest. GOI becomes degraded. Take cells, grow into selective media that leave you with the cell minus the gene of interest. Re insert the cells into the blastocyst. You are left with a chimeric mouse, cross breed the mice with normal mice until you get a heterozygote mouse with the gene knocked out. Finally, check for blood cell production.
