*Kelly Capital Growth Investment Criterion, The: Theory And Practice* Leonard C Maclean, Edward O Thorp, William T Ziemba, 2011-02-10. This volume provides the definitive treatment of fortune's formula or the Kelly capital growth criterion as it is often called. The strategy is to maximize long run wealth of the investor by maximizing the period by period expected utility of wealth with a logarithmic utility function. Mathematical theorems show that only the log utility function maximizes asymptotic long run wealth and minimizes the expected time to arbitrary large goals. In general, the strategy is risky in the short term but as the number of bets increases, the Kelly bettor's wealth tends to be much larger than those with essentially different strategies. So most of the time the Kelly bettor will have much more wealth than these other bettors but the Kelly strategy can lead to considerable losses a small percent of the time. There are ways to reduce this risk at the cost of lower expected final wealth using fractional Kelly strategies that blend the Kelly suggested wager with cash. The various classic reprinted papers and the new ones written specifically for this volume cover various aspects of the theory and practice of dynamic investing. Good and bad properties are discussed as are fixed mix and volatility induced growth strategies. The relationships with utility theory and the use of these ideas by great investors are featured.

*Stock Market Crashes: Predictable And Unpredictable And What To Do About Them* William T Ziemba, Mikhail Zhitlukhin, Sebastien Lleo, 2017-08-30 Overall the book provides an interesting and useful synthesis of the authors research on the predictions of stock market crashes The book can be recommended to anyone interested in the Bond Stock Earnings Yield Differential model and similar methods to predict crashes Quantitative Finance This book presents studies of stock market crashes big and small that occur from bubbles bursting or other reasons By a bubble we mean that prices are rising just because they are rising and that prices exceed fundamental values A bubble can be a large rise in prices followed by a steep fall The focus is on determining if a bubble actually exists on models to predict stock market declines in bubble like markets and exit strategies from these bubble like markets We list historical great bubbles of various markets over hundreds of years We present four models that have been successful in predicting large stock market declines of ten percent plus that average about minus twenty five percent The bond stock earnings yield difference model was based on the 1987 US crash where the S P 500 futures fell 29% in one day The model is based on earnings yields relative to interest rates When interest rates become too high relative to earnings there almost always is a decline in four to twelve months The initial out of sample test was on the Japanese stock market from 1948 88 There all twelve danger signals produced correct decline signals But there were eight other ten percent plus declines that occurred for other reasons Then the model called the 1990 Japan huge 56% decline We show various later applications of the model to US stock declines such as in 2000 and 2007 and to the Chinese stock market We also compare the model with high price earnings decline predictions over a sixty year period in the US We show that over twenty year periods that have high returns they all start with low price earnings ratios and end with high ratios High price earnings models have predictive value and the BSEYD models predict even better Other large decline prediction models are call option prices exceeding put prices Warren Buffett s value of the stock market to the value of the economy adjusted using BSEYD ideas and the value of Sotheby s stock Investors expect more declines than actually occur We present research on the positive effects of FOMC meetings and small cap dominance with Democratic Presidents Marty Zweig was a wall street legend while he was alive We discuss his methods for stock market predictability using momentum and FED actions These helped him become the leading analyst and we show that his ideas still give useful predictions in 2016 2017 We study small declines in the five to fifteen percent range that are either not expected or are expected but when is not clear For these we present methods to deal with these situations The last four January February 2016 Brexit Trump and French elections are analyzed using simple volatility S P 500 graphs Another very important issue is can you exit bubble like markets at favorable prices We use a stopping rule model that gives very good exit results This is applied successfully to Apple computer stock in 2012 the Nasdaq 100 in 2000 the Japanese

stock and golf course membership prices the US stock market in 1929 and 1987 and other markets We also show how to incorporate predictive models into stochastic investment models
