Volume 4 Rehabilitation Robotics is dedicated to the state of the art of an emerging interdisciplinary field where robotics sensors and feedback are used in novel ways to relearn improve or restore functional movements in humans. This volume attempts to cover a number of topics relevant to the field. The first section addresses an important activity in our daily lives walking where the neuromuscular system orchestrates the gait posture and balance. Conditions such as stroke vestibular deficits or old age impair this important activity. Three chapters on robotic training gait rehabilitation and cooperative orthoses describe the current works in the field to address this issue. The second section covers the significant advances in and novel designs of soft actuators and wearable systems that have emerged in the area of prosthetic lower limbs and ankles in recent years which offer potential for both rehabilitation and human augmentation. These are described in two chapters. The next section addresses an important emphasis in the field of medicine today that strives to bring rehabilitation out from the clinic into the home environment so that these medical aids are more readily available to users. The current state of the art in this field is described in a chapter. The last section focuses on rehab devices for the pediatric population. Their impairments are life long and rehabilitation robotics can have an even bigger impact during their lifespan. In recent years a number of new developments have been made to promote mobility socialization and rehabilitation among the very young the infants and toddlers. These aspects are summarized in two chapters of this volume.

future engineering systems will expand rapidly resulting in a completely new paradigm for solving a myriad of global problems. The second technology is industrial robots which is covered in Volume 2 on Robotics. Traditionally industrial robots have been used on mass production lines where the same manufacturing operation is repeated many times. Recent advances in human safe industrial robots present an opportunity for creating hybrid work cells where humans and robots can collaborate in close physical proximities. This Cobots or collaborative robots has opened up to opportunity for humans and robots to work more closely together. Recent advances in artificial intelligence are striving to make industrial robots more agile with the ability to adapt to changing environments and tasks. Additionally recent advances in force and tactile sensing enable robots to be used in complex manufacturing tasks. These new capabilities are expanding the role of robotics in manufacturing operations and leading to significant growth in the industrial robotics area. The third technology covered in Volume 3 is augmented and virtual reality. Augmented and virtual reality AR VR technologies are being leveraged by the manufacturing community to improve operations in a wide variety of ways. Traditional applications have included operator training and design visualization with more recent applications including interactive design and manufacturing planning human and robot interactions ergonomic analysis information and knowledge capture and manufacturing simulation. The advent of low cost solutions in these areas is accepted to accelerate the rate of adoption of these technologies in the manufacturing and related sectors. Consisting of chapters by leading experts in the world, Manufacturing in the Era of 4th Industrial Revolution provides a reference set for supporting graduate programs in the advanced manufacturing area.
