Lab Report Five

Purposes: This lab was to test our hypothesis that bacteria should be sensitive to UV light exposure and they should grow at an optimal temperature.

Materials:

- Agar Plates
- Test tubes
- Pipette
- Q-tips
- Bacteria
- Ultraviolet light
- Refrigerator
- Room temp incubator
- 37-degree incubator
- 55-degree incubator
- Marker

Methods:

Growth

1. Each lab table will take 5 agar plates.
2. Each person will remove a drop of bacterial culture from the tube cultures and pipette on an agar plate.
3. Spread the culture evenly over the plate with a sterile Q tip swab. Allow the liquid time to absorb into the agar.
4. Invert and incubate (face down) 4 of the plates at one of the following temperatures: 1) 4 °C (refrigerator), 2) 23°C (Room temp incubator), 3) 37°C (incubator), and 4) 55°C (incubator) incubate until the next lab period (48 hrs).
5. The 5th plate will be exposed to uv light as described below.

UV Light

1. Each table will take one agar plate and spread on it a lawn of bacteria as described above.

Eaton-Rye, Roman Sobotka, 2017-08-08 Photosystem II is a 700 kDa membrane protein super complex responsible for the light driven splitting of water in oxygenic photosynthesis The photosystem is comprised of two 350 kDa complexes each made of 20 different polypeptides and over 80 co factors While there have been major advances in understanding the mature structure of this photosystem many key protein factors involved in the assembly of the complex do not appear in the holoenzyme The mechanism for assembling this super complex is a very active area of research with newly discovered assembly factors and subcomplexes requiring characterization Additionally the ability to split water is inseparable from light induced photodamage that arises from radicals and reactive O₂ species generated by Photosystem II chemistry Consequently to sustain water splitting a self repair cycle has evolved whereby damaged protein is removed and replaced so as to extend the working life of the complex Understanding how the biogenesis and repair processes are coordinated is among several important questions that remain to be answered Other questions include how and when are the inorganic cofactors inserted during the assembly and repair processes and how are the subcomplexes protected from photodamage during assembly Evidence has also been obtained for Photosystem II biogenesis centers in cyanobacteria but do these also exist in plants Do the molecular mechanisms associated with Photosystem II assembly shed fresh light on the assembly of other major energy transducing complexes such as Photosystem I or the cytochrome b₆ f complex or indeed other respiratory complexes The contributions to this Frontiers in Plant Science Research Topic are likely to reveal new details applicable to the assembly of a range of membrane protein complexes including aspects of self assembly and solar energy conversion that may be applied to artificial photosynthetic systems In addition a deeper understanding of Photosystem II assembly particularly in response to changing environmental conditions will provide new knowledge underpinning photosynthetic yields which may contribute to improved food production and long term food security *Proteomics, Multi-Omics and Systems Biology in Optic Nerve Regeneration* Sanjoy K.
