Low Power Cmos Design Anantha Chandrakasan:

Low Power Digital CMOS Design Anantha P. Chandrakasan, Robert W. Brodersen, 1995-06-30 Power consumption has become a major design consideration for battery operated portable systems as well as high performance desktop systems. Strict limitations on power dissipation must be met by the designer while still meeting ever higher computational requirements. A comprehensive approach is thus required at all levels of system design ranging from algorithms and architectures to the logic styles and the underlying technology. Potentially one of the most important techniques involves combining architecture optimization with voltage scaling allowing a trade off between silicon area and low power operation. Architectural optimization enables supply voltages of the order of 1 V using standard CMOS technology. Several techniques can also be used to minimize the switched capacitance including representation optimizing signal correlations minimizing spurious transitions optimizing sequencing of operations activity driven power down etc. The high efficiency of DC DC converter circuitry required for efficient low voltage and low current level operation is described by Stratakis, Sullivan and Sanders. The application of various low power techniques to a chip set for multimedia applications shows that orders of magnitude reduction in power consumption is possible. The book also features an analysis by Professor Meindl of the fundamental limits of power consumption achievable at all levels of the design hierarchy. Svensson of ISI describes emerging adiabatic switching techniques that can break the CV²f barrier and reduce the energy per computation at a fixed voltage. Srivastava of AT T presents the application of aggressive shut down techniques to microprocessor applications.

Low-Power CMOS Design Anantha Chandrakasan, Robert W. Brodersen, 1998-02-11 This collection of important papers provides a comprehensive overview of low power system design from component technologies and circuits to architecture system design and CAD techniques. **LOW POWER CMOS DESIGN** summarizes the key low power contributions through papers written by experts in this evolving field. **Low Power Interconnect Design** Sandeep Saini, 2015-06-12 This book provides practical solutions for delay and power reduction for on chip interconnects and buses. It provides an in depth description of the problem of signal delay and extra power consumption possible solutions for delay and glitch removal while considering the power reduction of the total system. Coverage focuses on use of the Schmitt Trigger as an alternative approach to buffer insertion for delay and power reduction in VLSI interconnects. In the last section of the book various bus coding techniques are discussed to minimize delay and power in address and data buses. **Analysis and Solutions for Switching Noise Coupling in Mixed-Signal ICs** X. Aragones, J.L. Gonzalez, Antonio Rubio, 2013-03-09 Modern microelectronic design is characterized by the integration of full systems on a single die. These systems often include large high performance digital circuitry high resolution analog parts high driving I/O and maybe RF sections. Designers of such systems are constantly faced with the challenge to achieve compatibility in electrical characteristics of every section. Some circuitry presents fast transients and large consumption spikes whereas others require quiet environments to achieve

resolutions well beyond millivolts Coupling between those sections is usually unavoidable since the entire system shares the same silicon substrate bulk and the same package Understanding the way coupling is produced and knowing methods to isolate coupled circuitry and how to apply every method is then mandatory knowledge for every IC designer Analysis and Solutions for Switching Noise Coupling in Mixed Signal ICs is an in depth look at coupling through the common silicon substrate and noise at the power supply lines It explains the elementary knowledge needed to understand these phenomena and presents a review of previous works and new research results The aim is to provide an understanding of the reasons for these particular ways of coupling review and suggest solutions to noise coupling and provide criteria to apply noise reduction Analysis and Solutions for Switching Noise Coupling in Mixed Signal ICs is an ideal book both as introductory material to noise coupling problems in mixed signal ICs and for more advanced designers facing this problem *Low-power HF Microelectronics* Gerson A. Memory Optimizations of Embedded Applications for Energy Efficiency Jong Soo Park,2011 The current embedded processors often do not satisfy increasingly demanding computation requirements of embedded applications within acceptable energy efficiency whereas application specific integrated circuits require excessive design costs In the Stanford Elm project it was identified that instruction and data delivery not computation dominate the energy consumption of embedded processors Consequently the energy efficiency of delivering instructions and data must be sufficiently improved to close the efficiency gap between application specific integrated circuits and programmable embedded processors This dissertation demonstrates that the compiler and run time system can play a crucial role in improving the energy efficiency of delivering instructions and data Regarding instruction delivery I present a compiler algorithm that manages L0 instruction scratch pad memories that reside between processor cores and L1 caches Despite the lack of tags the scratch pad memories with our algorithm can achieve lower miss rates than caches with the same capacities saving significant instruction delivery energy Regarding data delivery I present methods that minimize memory space requirements for parallelizing stream applications applications that are commonly found in the embedded domain When stream applications are parallelized in pipelining large enough buffers are required between pipeline stages to sustain the throughput e g double buffering For static stream applications where production and consumption rates of stages are close to compile time constants a compiler analysis is presented which computes the minimum buffer capacity that maximizes the throughput Based on this analysis a new static streamscheduling algorithm is developed which yields considerable speed up and data delivery energy saving compared to a previous algorithm For dynamic stream applications I present a dynamically sized array based queue design that achieves speed up and data

delivery energy saving compared to a linked list based queue design
