

TRUE SALAMANDERS AND NEWTS (SALAMANDRIDAE)

HABITAT

A generalist species, but with a preference for largely open landscapes, including agricultural land. During the aquatic period common in flooded fields, but mostly more permanent ponds, lakes, springs and slow-flowing streams are used. Rarely in brackish water.

BIOLOGY

During terrestrial phase usually encountered underneath logs or stones, but active at night following periods of rain. Usually hibernates on land in N of range, but sometimes in water. Active between February and November in most areas, but this varies widely with climate and sometimes active throughout the year. Reproduction may start

in winter in S of range but more typically around March in N of range. Males court females by fanning pheromones from their cloaca towards potential mates using their tail-tip. A spermatophore is released and absorbed by the female. Females deposit up to 300 eggs individually, often folding aquatic vegetation around each egg. Freshly metamorphosed juveniles may be encountered in summer. At high elevations or in cold shady waters, larvae may spend the winter in the water to complete metamorphosis the subsequent year. Feeds on various arthropods, snails and worms, but also on the larvae of other amphibians. Like other newts, may be seen feeding on frog spawn in spring.

Andrews, 2024-05-21 Roads may threaten the persistence of wildlife populations by acting as barriers to movement and or sources of increased mortality across the landscape Amphibians and reptiles have been identified as being particularly susceptible to negative road impacts Many species migrate annually among habitats to support basic life history requirements such as breeding development foraging and overwintering For these species individuals may need to successfully cross roads multiple times each year for the population to persist Many are slow moving and freeze in the presence of danger making it almost impossible for them to avoid oncoming vehicles Although there are a plethora of road mortality location and count data the effects of road mortality on the long term viability of amphibian and reptile populations and metapopulations are mostly unknown due to a lack of information on their abundance vital rates behavior and spatial and temporal dynamics **Guide to the Taxonomic Literature of Vertebrates** Richard E.
