Snodgrass,2012-12-06 Temporal databases have been an active research topic for at least fifteen years During this time several dozen temporal query languages have been proposed Many within the temporal database research community perceived that the time had come to consolidate approaches to temporal data models and calculus based query languages to achieve a consensus query language and associated data model upon which future research can be based While there were many query language proposals with a diversity of language and modeling constructs common themes kept resurfacing However the community was quite frag mented with each research project being based on a particular and different set of assumptions and approaches Often these assumptions were not germane to the research per se but were made simply because the research required a data model or query language with certain characteristics with the partic ular one chosen rather arbitrarily It would be better in such circumstances for research projects to choose the same language Unfortunately no existing language had attracted a following large enough to become the one of choice In April 1992 Richard Snodgrass circulated a white paper that proposed that a temporal extension to SQL be produced by the research community Shortly thereafter the temporal database community organized the ARPA NSF In ternational Workshop on an Infrastructure for Temporal Databases which was held in Arlington TX in June 1993 **eBook: Database Systems Concepts 6e** SILBERSCHATZ,2010-06-16 eBook Database Systems Concepts 6e **Joe Celko's Data and Databases** Joe Celko,1999-08-10 This text covers basic database concepts to provide a conceptual understanding of data and databases necessary for database design and development **Fundamentals of Relational Database Management Systems** S. Harper,Moira C. Norrie,2013-03-09 Increasingly formal specification is being used by database researchers to describe and understand the systems they are designing and implementing Similarly those working on formal specification techniques have recognised that the database field provides a rich context for developing their ideas However as experts in one field often have a relatively limited knowledge of the other there is a growing need for discussion about the relationship between these two fields and how they can be usefully combined This volume contains the 16 papers which were presented at the International Workshop on Specification on Database Systems held in Glasgow 3 5 July 1991 The purpose of the workshop was to bring together these fields and to examine through a series of invited talks presentations and working groups the role that formal specification can play in developing database systems The papers describe current research into topics such as the formal specification of data models query languages and transaction handling and the use of formal specification techniques to understand problems which arise in database systems The working groups which are summarised at the end of the volume covered a variety of issues including the role of graphical notations in database specification the use of specification techniques in enabling open or extensible database systems and the education of the database community in

specification techniques This volume will be invaluable to the increasing number of researchers who are using both database systems and formal specification techniques in their work and who wish to gain a more detailed knowledge of these two fields and the issues which affect them
