realized networks. Consequently the main challenge in building complex and biophysically accurate SNNs is largely posed by the high computational and data transfer demands. Real Time Multi Chip Neural Network for Cognitive Systems presents novel real time reconfigurable multi chip SNN system architecture based on localized communication which effectively reduces the communication cost to a linear growth. The system uses double floating point arithmetic for the most biologically accurate cell behavior simulation and is flexible enough to offer an easy implementation of various neuron network topologies, cell communication schemes as well as models and kinds of cells. The system offers a high run time configurability which reduces the need for resynthesizing the system. In addition the simulator features configurable on and off chip communication latencies as well as neuron calculation latencies. All parts of the system are generated automatically based on the neuron interconnection scheme in use. The simulator allows exploration of different system configurations e.g. the interconnection scheme between the neurons, the intracellular concentration of different chemical compounds, ions which affect how action potentials are initiated and propagate.
