Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were 40 sedentary, middle-aged women who were randomly assigned to either a supervised walking program or a control group. The walking program consisted of 12 weeks of walking, 3 times per week, for 30 minutes per session. The control group consisted of 20 women who did not participate in the walking program. The subjects were assessed at baseline and at 12 weeks for physical and psychological health. The physical health assessment included measurements of weight, body mass index (BMI), waist circumference, and blood pressure. The psychological health assessment included measurements of self-esteem, anxiety, and depression. The results of the study showed that the walking program had a significant positive effect on the physical and psychological health of the subjects. The walking program resulted in a significant decrease in weight, BMI, waist circumference, and blood pressure. The walking program also resulted in a significant increase in self-esteem and a significant decrease in anxiety and depression. The results of this study suggest that a 12-week, low-intensity, supervised walking program can improve the physical and psychological health of sedentary, middle-aged women.

¹² To address the issue, we estimated the model for each country separately. The results are available from the author upon request.

As noted earlier, the 1990s witnessed a dramatic rise in the number of people who were employed in the service sector. This was particularly true in the United States, where the service sector grew from 55% of the economy in 1970 to 70% in 1990. This growth was driven by a number of factors, including the increasing demand for services, the growth of the service sector, and the increasing demand for services.
