Handbook Of Sample Preparation For Scanning Electron Microscopy And X Ray Microanalysis:

Handbook of Sample Preparation for Scanning Electron Microscopy and X-Ray Microanalysis Patrick Echlin, 2011-04-14 Scanning electron microscopy SEM and x ray microanalysis can produce magnified images and in situ chemical information from virtually any type of specimen The two instruments generally operate in a high vacuum and a very dry environment in order to produce the high energy beam of electrons needed for imaging and analysis With a few notable exceptions most specimens destined for study in the SEM are poor conductors and composed of beam sensitive light elements containing variable amounts of water In the SEM the imaging system depends on the specimen being sufficiently electrically conductive to ensure that the bulk of the incoming electrons go to ground The formation of the image depends on collecting the different signals that are scattered as a consequence of the high energy beam interacting with the sample Backscattered electrons and secondary electrons are generated within the primary beam sample interactive volume and are the two principal signals used to form images The backscattered electron coefficient increases with increasing atomic number of the specimen whereas the secondary electron coefficient is relatively insensitive to atomic number This fundamental difference in the two signals can have an important effect on the way samples may need to be prepared The analytical system depends on collecting the x ray photons that are generated within the sample as a consequence of interaction with the same high energy beam of primary electrons used to produce images

Scanning Electron Microscopy, X-Ray Microanalysis, and Analytical Electron Microscopy Charles E. Lyman, Dale E. Newbury, Joseph Goldstein, David B. Williams, Alton D. Romig Jr., John Armstrong, Patrick Echlin, Charles Fiori, David C. Joy, Eric Lifshin, Klaus-Rüdiger Peters, 2012-12-06 During the last four decades remarkable developments have taken place in instrumentation and techniques for characterizing the microstructure and microcomposition of materials Some of the most important of these instruments involve the use of electron beams because of the wealth of information that can be obtained from the interaction of electron beams with matter The principal instruments include the scanning electron microscope electron probe x ray microanalyzer and the analytical transmission electron microscope The training of students to use these instruments and to apply the new techniques that are possible with them is an important function which has been carried out by formal classes in universities and colleges and by special summer courses such as the ones offered for the past 19 years at Lehigh University Laboratory work which should be an integral part of such courses is often hindered by the lack of a suitable laboratory workbook While laboratory workbooks for transmission electron microscopy have been in existence for many years the broad range of topics that must be dealt with in scanning electron microscopy and microanalysis has made it difficult for instructors to devise meaningful experiments The present workbook provides a series of fundamental experiments to aid in hands on learning of the use of the instrumentation and the techniques It is written by a group of eminently qualified scientists and educators The importance of hands on learning cannot be overemphasized **Low**

Biodegradable Poly (hydroxyalkanoates) Qi Liao, 2010 Plastic materials have a huge impact to the environment EPA statistics shows that less than 7% of the plastic products are being recycled and many of the rest are sent to landfills or in worse scenarios end up in our natural environment Poly hydroxyalkanoates PHAs a family of biodegradable polyesters that can be produced by microbes fed on renewable carbon substrates can be used as a green substitute to conventional plastics and help solve this environmental problem However difficulties remain for using PHAs at a sizable scale Besides the high production cost weaknesses in material properties including narrow thermal processing window and insufficient melt elasticity are also limiting the application of PHAs Recent progress in PHA syntheses has resulted in new copolymers in the PHA family which are expected to possess improved properties In this thesis the melt properties of a series of one such copolymer poly 3 hydroxybutyrate co 3 hydroxyhexanoate P3HB co 3HHx with varying 3HHx content were investigated Results suggested that

the presence of the propyl side groups on 3HHx increases the steric hindrance of the P3HB co 3HHx chains thus resulting in increased entanglement density and subsequently the melt elasticity Solid state properties of P3HB co 3HHx were also studied and the effects on biodegradability of thin films of P3HB co 3HHx were investigated Results show that varying copolymer composition in combination with modifying the crystalline morphology through heat treatment may enable control over biodegradation rates for PHAs materials In addition biodegradable cellular foams made of PHAs were synthesized through extrusion foaming a standard melt processing for thermoplastics A commercial PHA copolymer poly 3 hydroxybutyrate co 3 hydroxyvalerate P3HB co 3HV was used and evaluated for its foamability Another naturally derived polymer cellulose acetate butyrate CAB was chosen to blend with P3HB co 3HV to enhance its melt properties and processability It was found that blending significantly improved the thermal processing window and enhanced melt elasticity Results showed that selectively combining two types of bio based renewable polymer could be an effective way to tune the melt properties and crystallinity and thus the processability
