Engineers and the Making of the Francoist Regime Lino Camprubi, 2014-05-02 How engineers and agricultural scientists became key actors in Franco s regime and Spain s forced modernization In this book Lino Camprub argues that science and technology were at the very center of the building of Franco s Spain Previous histories of early Francoist science and technology have described scientists and engineers as working under Francoism subject to censorship and bound by politically mandated research agendas Camprub offers a different perspective considering instead scientists and engineers active roles in producing those political mandates Many scientists and engineers had been exiled imprisoned or executed by the regime Camprub argues that those who remained

made concrete the mission of redemption that Franco had invented for himself This gave them the opportunity to become key actors and mid level decision makers within the regime Camprub describes a series of projects across Spain undertaken by the civil engineers and agricultural scientists who placed themselves at the center of their country s forced modernization These include a coal silo built in 1953 viewed as an embodiment of Spain s industrialized landscape links between laboratories architects and the national Catholic church and between technology and authoritarian control vertically organized rice production and research on genetics river management and the contested meanings of self sufficiency and the circulation of construction standards by mobile laboratories as an engine for European integration Separately each chapter offers a fascinating microhistory that illustrates the coevolution of Francoist science technology and politics Taken together they reveal networks of people institutions knowledge artifacts and technological systems woven together to form a new state
