,1997 American Book Publishing Record ,2001 HPC@Green IT Ralf Gruber,Vincent Keller,2010-03-15 Making the most efficient use of computer systems has rapidly become a leading topic of interest for the computer industry and its customers alike However the focus of these discussions is often on single isolated and specific architectural and technological improvements for power reduction and conservation while ignoring the fact that power efficiency as a ratio of performance to power consumption is equally influenced by performance improvements and architectural power reduction Furthermore efficiency can be influenced on all levels of today's system hierarchies from single cores all the way to distributed Grid environments To improve execution and power efficiency requires progress in such diverse fields as program optimization optimization of program scheduling and power reduction of idling system components for all levels of the system hierarchy Improving computer system efficiency requires improving system performance and reducing system power consumption To research and reach reasonable conclusions about system performance we need to not only understand the architectures of our computer systems and the available array of code transformations for performance optimizations but we also need to be able to express this understanding in performance models good enough to guide decisions about code optimizations for specific systems This understanding is necessary on all levels of the system hierarchy from single cores to nodes to full high performance computing HPC systems and eventually to Grid environments with multiple systems and resources

Katz,Karen Hunger Parshall,2020-04-07 What is algebra For some it is an abstract language of  $x$ 's and  $y$ 's For mathematics majors and professional mathematicians it is a world of axiomatically defined constructs like groups rings and fields Taming the Unknown considers how these two seemingly different types of algebra evolved and how they relate Victor Katz and Karen Parshall explore the history of algebra from its roots in the ancient civilizations of Egypt Mesopotamia Greece China and India through its development in the medieval Islamic world and medieval and early modern Europe to its modern form in the early twentieth century Defining algebra originally as a collection of techniques for determining unknowns the authors trace the development of these techniques from geometric beginnings in ancient Egypt and Mesopotamia and classical Greece They show how similar problems were tackled in

Alexandrian Greece in China and in India then look at how medieval Islamic scholars shifted to an algorithmic stage which was further developed by medieval and early modern European mathematicians With the introduction of a flexible and operative symbolism in the sixteenth and seventeenth centuries algebra entered into a dynamic period characterized by the analytic geometry that could evaluate curves represented by equations in two variables thereby solving problems in the physics of motion This new symbolism freed mathematicians to study equations of degrees higher than two and three ultimately leading to the present abstract era Taming the Unknown follows algebra s remarkable growth through different epochs around the globe      **El-Hi Textbooks in Print** ,1984
