Heavy Metals Removal From Liquid Waste Using Granular Activated Carbon:

Heavy Metals Removal from Liquid Waste Using Granular Activated Carbon Muzher Mahdi Ibrahim AlDoury, Abbas Ali Al-kanoosh, 2014-11-25 Heavy metals represent an important source of environmental pollution Oil and petrochemical industries produce considerable amounts of heavy metals that finds its way to water sources such as rivers lakes sea and ground water in addition to soil Biological treatment units are unable to remove these metals since they are non biodegradable Considerable attention had been given for the treatment of heavy metals in recent years North oil refineries company in Baiji suffer from the presence of many heavy metals in the discharged wastewater from biological treatment unit The concentration of many of these heavy metals concentrations exceed the allowable concentrations according to the Iraqi limits The present work is a trial to treat Copper Manganese and Zinc from a synthetic wastewater using activated carbon The study proved that these metals can be removed completely However the breakthrough and exhaustion times for Zinc are lower than that of Copper and Manganese The study proved also that adsorption capacity is not a pure property of activated carbon but it depends on the operating conditions and the type of adsorbent and adsorbate and their characteristics

The Utilization of Bioremediation to Reduce Soil Contamination: Problems and Solutions Václav Sasek, John A. Glaser, P. Baveye, 2012-12-06 Traditional reliance on chemical analysis to understand the direction and extent of treatment in a bioremediation process has been found to be inadequate Whereas the goal of bioremediation is toxicity reduction few direct reliable measures of this process are as yet available Another area of intense discussion is the assessment of market forces contributing to the acceptability of bioremediation Finally another important component is a series of lectures and lively exchanges devoted to practical applications of different bioremediation technologies The range of subjects covers a wide spectrum encompassing emerging technologies as well as actual full scale operations Examples discussed include

landfarming biopiling composting phytoremediation and mycoremediation Each technology is explored for its utility and capability to provide desired treatment goals Advantages and limitations of each technology are discussed The concept of natural attenuation is also critically evaluated since in some cases where time to remediation is not a significant factor it may be an alternative to active bioremediation operations
