Hepatitis B And C Hepatitis B And C:

A National Strategy for the Elimination of Hepatitis B and C National Academies of Sciences, Engineering, and Medicine, Health and Medicine Division, Board on Population Health and Public Health Practice, Committee on a National Strategy for the Elimination of Hepatitis B and C, 2017-07-30 Hepatitis B and C cause most cases of hepatitis in the United States and the world. The two diseases account for about a million deaths a year and 78 percent of world's hepatocellular carcinoma and more than half of all fatal cirrhosis. In 2013, viral hepatitis of which hepatitis B virus (HBV) and hepatitis C virus (HCV) are the most common types surpassed HIV and AIDS to become the seventh leading cause of death worldwide. The world now has the tools to prevent hepatitis B and cure hepatitis C. Perfect vaccination could eradicate HBV but it would take two generations at least. In the meantime, there is no cure for the millions of people already infected. Conversely, there is no vaccine for HCV but new direct acting antivirals can cure 95 percent of chronic infections though these drugs are unlikely to reach all chronically infected people anytime soon. This report is the second of two builds off the conclusions of the first report and outlines a strategy for hepatitis reduction over time and specific actions to achieve them. [Eliminating the Public Health Problem of Hepatitis B and C in the United States](#) National Academies of Sciences, Engineering, and Medicine, Health and Medicine Division, Board on Population Health and Public Health Practice, Committee on a National Strategy for the Elimination of Hepatitis B and C, 2016-06-01 Hepatitis B and C cause most cases of hepatitis in the United States and the world. The two diseases account for about a million deaths a year and 78 percent of world's hepatocellular carcinoma and more than half of all fatal cirrhosis. In 2013, viral hepatitis of which hepatitis B virus (HBV) and hepatitis C virus (HCV) are the most common types surpassed HIV and AIDS to become the seventh leading cause of death worldwide. The world now has the tools to prevent hepatitis B and cure hepatitis C. Perfect vaccination could eradicate HBV but it would take two generations at least. In the meantime, there is no cure for the millions of people already infected. Conversely, there is no vaccine for HCV but new direct acting antivirals can cure 95 percent of chronic infections though these drugs are unlikely to reach all chronically infected people anytime soon. This report is the first of two examines the feasibility of hepatitis B and C elimination in the United States and identifies critical success factors. The phase two report will outline a strategy for meeting the elimination goals discussed in this report. **Hepatitis and Liver Cancer** Institute of Medicine, Board on Population Health and Public Health Practice, Committee on the Prevention and Control of Viral Hepatitis Infections, 2010-05-23 The global epidemic of hepatitis B and C is a serious public health problem. Hepatitis B and C are the major causes of chronic liver disease and liver cancer in the world. In the next 10 years, 150,000 people in the United States will die from liver disease or liver cancer associated with chronic hepatitis B virus (HBV) or hepatitis C virus (HCV) infections. Today, between 800,000 and 1.4 million people in the United States have chronic hepatitis B and between 2.7 and 3.9 million have chronic hepatitis C. People most at risk for hepatitis B and C often are the least likely to have access to medical services. Reducing the rates of illness and death

associated with these diseases will require greater awareness and knowledge among health care workers improved identification of at risk people and improved access to medical care Hepatitis B is a vaccine preventable disease Although federal public health officials recommend that all newborns children and at risk adults receive the vaccine about 46 000 new acute cases of the HBV infection emerge each year including 1 000 in infants who acquire the infection during birth from their HBV positive mothers Unfortunately there is no vaccine for hepatitis C which is transmitted by direct exposure to infectious blood Hepatitis and Liver Cancer identifies missed opportunities related to the prevention and control of HBV and HCV infections The book presents ways to reduce the numbers of new HBV and HCV infections and the morbidity and mortality related to chronic viral hepatitis It identifies priorities for research policy and action geared toward federal state and local public health officials stakeholder and advocacy groups and professional organizations *The Encyclopedia of Hepatitis and Other Liver Diseases* James H.
