Understanding convergent evasion mechanisms in cancer and chronic infection: Implications for immunotherapy

Matthias Theobald,Hansjörg Schild,2024-06-04 The complex interactions between the innate and adaptive immune systems function to recognize and clear pathogens or transformed cells but inefficient interactions between these two systems can result in harmful immunologic responses including chronic infections and the development of cancer Several hallmarks of dysfunctional adaptive immune responses often detected in tumors share specific features with ineffective immunity in chronic infections The members of the micromilieu actively participate in the process of tumorigenesis or chronification of infection by modulating innate and adaptive immune system interactions leading e g to insufficient T cell responses The best example is given by the acquisition of an exhausted state of cytotoxic CD8 T cells CTLs responding to chronic infections or tumors that are associated with elevated expression of inhibitory receptors and impaired cytokine response Targeting these major inhibitory pathways by immune checkpoint blockers represents a prime example of successful clinical translation of tumor specific immunotherapies Understanding the mechanisms behind mal adaptations of the immune system is crucial for achieving therapeutic benefits The establishment and co evolution of a dynamic microenvironment niche constituted by the recruitment of numerous cell types dampen immune responses and thus contribute to the development of neoplastic transformation as well as infection Although there are examples of successful immunotherapeutic approaches CAR T cells immune checkpoint inhibitors or mRNA vaccination a large percentage of patients with cancer or chronic infections still do not benefit from these therapies or develop severe immune related adverse events The reasons for these failures are not well understood A possible explanation might be that current immunotherapies target predominantly the effector arm of the immune system by trying to reactivate dysfunctional T cells but do not sufficiently address the influence of the innate immune system and the contributions of the tumor microenvironment TME niche The main problem we would like to address in this special issue is how inappropriate function of the innate immune system affects adaptive immunity and contributes to inefficient anti cancer immunity and chronification of infections The central goal is to provide a more precise understanding of the various common and novel immune evasion mechanisms in cancers and in chronic infections to obtain a detailed map of common and disease specific immune escape checkpoints To that aim we want to compile a wide array of interdisciplinary studies exploring a comparative and multi layered analysis of mechanisms responsible for inefficient immune responses including novel approaches i e multi omics or epigenetic signaling We would also like to combine studies from different fields including basic and clinical immunology oncology and virology microbiology We welcome the submission of Original Research Review Mini Review Methods Case report and Perspective articles that cover but are not limited to the following topics Convergent mechanisms supporting immune escape in preclinical models tumors and chronic infections Convergent

evasion mechanisms mediated by tumor infiltrating suppressive cells Treg MDSC macro phages soluble mediators signaling metabolism Convergent immune evasion mechanisms mediated by chronic infection viral or parasite Novel strategies to modulate the TME by direct or indirect targeting of immune suppressor cells Approaches to enhance persistence and resilience of anticancer T cells Combinatorial therapeutic strategies mRNA antibodies immune checkpoint blockers that target convergent immune evasion mechanisms Manuscripts consisting solely of bioinformatics or computational analysis of public genomic or transcriptomic databases which are not accompanied by robust and relevant validation clinical cohort or biological validation in vitro or in vivo are out of scope for this topic

Chronic Hepatitis B Virus Infection in the Chinese, 2001 Uncorrected OCR Abstract of thesis entitled Chronic Hepatitis B Virus Infection in the Chinese Natural History Sequelae Treatment and Prevention Submitted by Yuen Man Fung for the degree of Doctor of Medicine at The University of Hong Kong in August 2001 The aims of this thesis were 1 to delineate the natural history of Chinese patients with hepatitis B virus HBV infection 2 to assess the two approved treatment interferon alpha IFN α and lamivudine of HBV 3 to study the pathogenesis immunology screening program and treatment of HCC and 4 to evaluate HBV vaccines in preventing HBV infection In a study of 146 Chinese HBV patients mannose binding lectin mutation was associated with increased chance of cirrhotic complications The most important factor for the development of cirrhotic complications in a study of 3433 Chinese HBV patients was increasing age The median age of development of cirrhotic complications was 55-60 years old Though HBeAg seroconversion led to a low viraemic state 60-70% of patients who had cirrhotic complications were anti HBe positive HBeAg seroconversion did not protect Chinese patients from the development of cirrhotic complications IFN α treatment improves prognosis in Caucasian HBV patients But a nine year follow up study involving 411 Chinese patients showed that IFN α treatment did not increase cumulative HBeAg seroconversion rate and more importantly did not decrease cirrhotic complication Prolonged lamivudine treatment is associated with the emergence of YMDD variants The factors associated with HBV DNA breakthrough were examined in 159 patients Patients with higher baseline HBV DNA and alanine transaminase ALT levels were associated with earlier YMDD variants development Patients with HBV DNA levels 103

copies/ml at 6 months of therapy had 63% chance of developing YMDD variant within 29 months of follow up. Patients with YMDD variants could still develop HBeAg seroconversion. The pathogenic role of YMDD variants is still unclear.

Chronic Hepatitis B Virus Infection Stephen John Williams, 1989

Hepatitis B Treatment Kandice Holverson, 2015-05-07

Hepatitis B is an infectious disease caused by a virus that attacks the DNA of your body's cells. It can occur without symptoms in some individuals until the infection becomes life-threatening. For this reason, early detection and early action are crucial so as to prevent further complications and begin treatment measures. However, finding a cure for Hepatitis B virus can be a challenging task because people respond differently to medication. Since there is no single treatment for the condition and viruses are difficult to destroy, it is important to get a proper diagnosis from your doctor and commence treatment immediately after. Delaying this process can worsen the condition. This book is designed to help you become aware of the various treatment options for Hepatitis B. It will also present simple self-help guidelines that you can adopt to help cure the infection at home. Other valuable tips are also included to provide you with plenty of sufficient information to understand, effectively manage, and successfully combat your Hep B so that you never have to worry about it again.
