Structure-Property Relationships under Extreme Dynamic Environments Cyril L. Williams, 2022-05-31

The inelastic response and residual mechanical properties acquired from most shock compressed solids are quite different from those acquired from quasi static or moderate strain rates For instance the residual hardness of many shock compressed metals has been found to be considerably lower than those loaded under quasi static conditions to the same maximum stress However the residual hardness of shock compressed metals is much higher than those loaded quasi statically to the same total strain These observations suggest that the deformation mechanisms active during inelastic deformation under shock compression and quasi static or moderate rates may be quite different Therefore the primary objective of this short book is to offer the reader a concise introduction on the Structure Property Relationships concerning shock compressed metals and metallic alloys via shock recovery experiments The first phase of the book chapters 1 through 3 provides a brief historical perspective on the structure property relationships as it pertains to shock compression science then plastic deformation in shock compressed metals and metallic alloys is described in terms of deformation slip deformation twinning and their consequences to spall failure Existing knowledge gaps and limitations on shock recovery experiments are also discussed The fundamentals of shock wave propagation in condensed media are presented through the formation and stability of shock waves then how they are treated using the Rankine Hugoniot jump relations derived from the conservation of mass momentum and energy The equation of

states which govern the thermodynamic transition of a material from the unshock state to the shock state is briefly described and the elastic plastic behavior of shock compressed solids is presented at the back end of the first phase of this book The second phase of the book describes the geometry and design of shock recovery experiments using explosives gas and powder guns Then results derived from the residual mechanical properties microstructure changes and spall failure mechanisms in shock compressed metals and metallic alloys with FCC BCC and HCP crystal lattice structures are presented Also results on the residual microstructure of explosively compacted powders and powder mixtures are presented Lastly the book closes with the new frontiers in shock recovery experiments based on novel materials novel microscopes novel mechanical processing techniques and novel time resolved in situ XRD shock experiments
