Infant Perception and Cognition Lisa M. Oakes, 2011 The cognitive revolution in the 1950s and 1960s led researchers to view the human mind like a computer

as an information processing system that encodes represents and stores information and is constrained by limits on hardware the brain and software learning strategies and rules The emergence of new behavioral computational and neuroscience methodologies has deeply expanded psychologists understanding of the workings of the infant child and adult mind One result is that research has focused on mechanisms of change over developmental time in the information processing mind In this book Lisa Oakes Cara Cashon Marianella Casasola and David Rakison bring together the recent findings and theories about the origins and early development of the information processing mind and provide insight into the future directions in the study of infant perception and cognition The contributors represent a wide range of research areas in the study of infant perception and cognition who emphasize the use of diverse methodological techniques to address key questions about development Their chapters demonstrate how the combination of historical perspectives on the information processing approach to cognition and recent advances in behavioral computational and neuroscience approaches to cognition has contributed to our understanding of how abilities ranging from visual attention to face processing to object categorization have developed during infancy Across this broad range of topics it is clear that much of our modern understanding of infant perceptual and cognitive development emerges from the foundation of classic information processing models of development such as that of Leslie B Cohen 1991 The recent advances illustrated in this book show how researchers have built on this foundation to uncover the mechanisms that drive developmental change
