wracked the planet interfingering with dramatic changes in oceanic and atmospheric chemistry and marked changes in continental configuration. It was during these dynamic and weedy times that metazoans first appeared diversified culminating in the appearance of hard tissue skeletons and deep farming of the marine substrate in late Proterozoic and first few millions of years of the Phanerozoic. This book is the culmination of two symposia of UNESCO International Geological Correlation Project 493 one in Prato Italy in 2004 the second in Kyoto Japan in 2006. Both dealt specifically with the precise timing of physical events and teasing out of the effects which these changing environments climates global chemistry and palaeogeography had on the development and diversification of animals culminating in the spectacular Ediacaran Vendian faunas of the late Precambrian.

Evolving Pathways Giuseppe Fusco, 2008-01-10 Evolutionary developmental biology or evo devo is the study of the relationship between evolution and development. Dealing specifically with the generative mechanisms of organismal form evo devo goes straight to the core of the developmental origin of variation the raw material on which natural selection and random drift can work. *Evolving Pathways* brings together contributions that represent a diversity of approaches. Topics range from developmental genetics to comparative morphology of animals and plants alike and also include botany and palaeontology two disciplines for which the potential to be examined from an evo devo perspective has largely been ignored until now. Researchers and graduate students will find this book a valuable overview of current research as we begin to fill a major gap in our perception of evolutionary change.
