Liquid Culture Systems For In Vitro Plant Propagation:

Liquid Culture Systems for in vitro Plant Propagation A.K. Hvorslef-Eide, W. Preil, 2005-06-15 High efficiency micropropagation with relatively low labour costs has been demonstrated in this unique book detailing liquid media systems for plant tissue culture World authorities e.g. von Arnold, Curtis, Takayama, Ziv contribute seminal papers together with papers from researchers across Europe that are members of the EU COST Action 843 Advanced micropropagation systems First hand practical applications are detailed for crops including ornamentals and trees using a wide range of techniques from thin film temporary immersion systems to more traditional aerated bioreactors with many types of explant shoots to somatic embryos The accounts are realistic, balanced and provide a contemporary account of this important aspect of mass propagation This book is essential reading for all those in commercial micropropagation labs as well as researchers worldwide who are keen to improve propagation techniques and lower economic costs of production Undergraduate and postgraduate students in the applied plant sciences and horticulture will find the book an enlightened treatise Disposable Bioreactors Regine Eibl, Dieter Eibl, 2009-11-27 Over the past five years the immense financial pressure on the development and manufacturing of biopharmaceuticals has resulted in the increasing use and acceptance of disposables which are discarded after harvest and therefore intended only for single use In fact such disposables are implemented in all the main bioprocess production stages today and an even higher growth than those in the biopharmaceutical market is predicted reaching double figures Alongside disposable filter capsules, membrane chromatography units, tubing, connectors, flexible containers, processing or containing fluids, freezer systems, mixers and pumps and fully controlled disposable bioreactors of up to 2 000 L culture volume are already available on the market Numerous studies highlight the advantages of disposable bioreactors and reveal their potential for simple, safe and fast seed inoculum production process development and small as well as middle volume production e.g. bioactive substances, viruses for vaccines and gene therapies etc They suggest that such disposable bioreactors, typically characterized by the cultivation chamber or bag from plastic materials, may be advantageous for plant, animal and microbial cells Running industrial activities such as CFD modelling, development of single use process monitoring and control technology and standardized film formulations are attempting to resolve the limitations of the current disposable bioreactors These achievements along with substantial improvements in product yield will reduce the use of stainless steel in the biomanufacturing facilities of the future *Plant Propagation by Tissue Culture* Edwin F. George, Michael A. Hall, Geert-Jan De Klerk, 2007-10-24 For researchers and students George's books have become the standard works on in vitro plant propagation For this the third edition of the classic work, authors with specialist knowledge have been brought on board to cover the hugely expanded number of topics in the subject area Scientific knowledge has expanded rapidly since the second edition and it would now be a daunting task for a single author to cover all aspects adequately However this edition still maintains the integration that was characteristic of the previous editions The first

volume of the new edition highlights the scientific background of in vitro propagation The second volume covers the practice of micropropagation and describes its various applications

Cell and Tissue Reaction Engineering Regine Eibl, Dieter Eibl, Ralf Pörtner, Gerardo Catapano, Peter Czermak, 2008-09-30 The completion of the Human Genome Project and the rapid progress in cell biology and biochemical engineering are major forces driving the steady increase of approved biotech products especially

biopharmaceuticals in the market Today mammalian cell products products from cells primarily monoclonals cytokines recombinant glycoproteins and increasingly vaccines dominate the biopharmaceutical industry Moreover a small number of products consisting of in vitro cultivated cells cells as product for regenerative medicine have also been introduced in the market Their efficient production requires comprehensive knowledge of biological as well as biochemical mammalian cell culture fundamentals e g cell characteristics and metabolism cell line establishment culture medium optimization and related engineering principles e g bioreactor design process scale up and optimization In addition new developments focusing on cell line development animal free culture media disposables and the implications of changing processes multi purpose facilities have to be taken into account While a number of excellent books treating the basic methods and applications of mammalian cell culture technology have been published only little attention has been afforded to their engineering aspects The aim of this book is to make a contribution to closing this gap it particularly focuses on the interactions between biological and biochemical and engineering principles in processes derived from cell cultures It is not intended to give a comprehensive overview of the literature This has been done extensively elsewhere

Step Wise Protocols for Somatic Embryogenesis of Important Woody Plants Shri Mohan Jain, Pramod Gupta, 2018-05-30 World population is increasing at an alarming rate and this has resulted in increasing tremendously the demand for tree products such as wood for construction materials fuel and paper fruits oils and medicines etc This has put immense pressure on the world s supplies of trees and raw material to industry and will continue to do so as long as human population continues to grow Also the quality of human diet especially nutritional components is adversely affected due to limited genetic improvement of most of fruit trees Thus there is an immediate need to increase productivity of trees Improvement has been made through conventional breeding methods however conventional breeding is very slow due to long life cycle of trees A basic strategy in tree improvement is to capture genetic gain through clonal propagation Clonal propagation via organogenesis is being used for the production of selected elite individual trees However the methods are labour intensive costly and produce low volumes Genetic gain can now be captured through somatic embryogenesis Formation of embryos from somatic cells by a process resembling zygotic embryogenesis is one of the most important features of plants In 1958 Reinert in Germany and Steward in USA independently reported somatic embryogenesis in carrot cultures Since then tremendous progress in somatic embryogenesis of woody and non woody plants has taken place It offers a potentially large scale propagation system for superior clones
