Abstract: *Chlamydia trachomatis* is the most common bacterial sexually transmitted infection (STI) in the United States. The purpose of this study was to determine the prevalence of *C. trachomatis* in a community-based sample of young adults. A cross-sectional study was conducted in a community-based sample of 1,000 young adults (ages 18-24) in a large, urban, multiethnic community. The prevalence of *C. trachomatis* was 1.2% (95% CI 0.4-2.0%). The prevalence of *C. trachomatis* was significantly higher among those who reported sexual activity in the past 12 months (2.1%) compared to those who did not (0.1%). The prevalence of *C. trachomatis* was significantly higher among those who reported sexual activity with a new partner in the past 12 months (3.1%) compared to those who did not (0.1%). The prevalence of *C. trachomatis* was significantly higher among those who reported sexual activity with a partner who had a sexually transmitted infection in the past 12 months (3.1%) compared to those who did not (0.1%). The prevalence of *C. trachomatis* was significantly higher among those who reported sexual activity with a partner who had a sexually transmitted infection in the past 12 months (3.1%) compared to those who did not (0.1%).
