medicine interested in applying IRT methods this book also serves as a text in advanced graduate courses on IRT or measurement Familiarity with factor analysis latent variables IRT and basic measurement theory is assumed The Oxford Handbook of Psychological Situations John F. Rauthmann, Ryne Sherman, David C. Funder, 2020-07-01 Situations matter They let people express their personalities and values provoke motivations emotions and behaviors and are the contexts in which people reason and act The psychological assessment of situations is a new and rapidly developing area of research particularly within the fields of personality and social psychology This volume compiles state of the art knowledge on psychological situations in chapters written by experts in their respective research areas Bringing together historical reviews theoretical pieces methodological descriptions and empirical applications this volume is the definitive go to source for a psychology of situations Multivariate Applications in Substance Use Research Jennifer S. Rose, Laurie Chassin, Clark C. Presson, Steven J. Sherman, 2000-01-01 This edited volume introduces the latest advances in quantitative methods and illustrates ways to apply these methods to important questions in substance use research The goal is to provide a forum for dialogue between methodologists developing innovative multivariate statistical methods and substance use researchers who have produced rich data sets Reflecting current research trends the book examines the use of longitudinal techniques to measure processes of change over time Researchers faced with the task of studying the causes course treatment and prevention of substance use and abuse will find this volume helpful for applying these techniques to make optimal use of their data This innovative volume introduces the use of latent curve methods for describing individual trajectories of adolescent substance use over time explores methods for analyzing longitudinal data for individuals nested within groups such as families classrooms and treatment groups demonstrates how different patterns of missing data influence the interpretation of results reports on some recent advances in longitudinal growth modeling illustrates methods to assess mediation when there are multiple mediating pathways underlying an intervention effect describes methods to identify moderating relations in structural equation models demonstrates the use of structural equation models to evaluate a preventive intervention applies epidemic modeling techniques to understand the spread of substance use in society illustrates the use of latent transition analysis to model substance use as a series of stages and applies logistic regression to prospectively predict smoking cessation *Modeling and Measuring Competencies in Higher Education* Sigrid Blömeke, Olga Zlatkin-Troitschanskaia, Christiane Kuhn, Judith Fege, 2013-04-20 Measuring competencies acquired over the course of higher education is an area of research that largely has been neglected This deficit can be attributed to the complexity of academic competencies since the variety of institutions programs occupational fields and job requirements render it difficult to define and even harder to measure outcomes Thus assessing the preconditions for and effects of competency development is a challenge methodologically In this book a comprehensive review of the international state of research on modeling and measuring competencies in higher education across several academic disciplines is presented

along with an evaluation of the field's strengths and weaknesses. Renowned experts share insight into the most important recent research projects and point out controversies and challenges. Competencies are regarded as context-specific dispositions acquired and required to cope successfully with domain-specific situations and tasks. However, the range of these dispositions is controversial. Should only cognitive facets be included, or is it important to consider attitudes as well? Insufficient response rates and panel attrition are further challenges, as are the limitations of paper and pencil approaches to the complex measurement of higher education outcomes. Thus, this book may serve as a platform for the exchange of research experiences and perspectives and hopefully will instigate improvements in research into higher education.

Multilevel Modeling Steven P. Reise, Naihua Duan, 2003-01-30 This book appeals to researchers who work with nested data structures or repeated measures data, including biomed health researchers, clinical intervention researchers, and developmental educational psychologists. Also, some potential as a grad-level text.

What If There Were No Significance Tests? Lisa L. Harlow, Stanley A. Mulaik, James H. Steiger, 2016-03-02 The classic edition of *What If There Were No Significance Tests* highlights current statistical inference practices. Four areas are featured as essential for making inferences sound judgment: meaningful research questions, relevant design, and assessing fit in multiple ways. Other options: data visualization, replication, or meta-analysis. Other features: mediation, moderation, multiple levels or classes, and other approaches. Bayesian analysis, simulation, data mining, qualitative inquiry are also suggested. The Classic Edition's new Introduction demonstrates the ongoing relevance of the topic and the charge to move away from an exclusive focus on NHST, along with new methods to help make significance testing more accessible to a wider body of researchers to improve our ability to make more accurate statistical inferences. Part 1 presents an overview of significance testing issues. The next part discusses the debate in which significance testing should be rejected or retained. The third part outlines various methods that may supplement significance testing procedures. Part 4 discusses Bayesian approaches and methods and the use of confidence intervals versus significance tests. The book concludes with philosophy of science perspectives. Rather than providing definitive prescriptions, the chapters are largely suggestive of general issues, concerns, and application guidelines. The editors allow readers to choose the best way to conduct hypothesis testing in their respective fields. For anyone doing research in the social sciences, this book is bound to become must-reading. Ideal for use as a supplement for graduate courses in statistics or quantitative analysis taught in psychology, education, business, nursing, medicine, and the social sciences, the book also benefits independent researchers in the behavioral and social sciences and those who teach statistics.

Applied Statistics: From Bivariate Through Multivariate Techniques Rebecca M. Warner, 2013 Rebecca M. Warner's *Applied Statistics: From Bivariate Through Multivariate Techniques*, Second Edition, provides a clear introduction to widely used topics in bivariate and multivariate statistics, including multiple regression, discriminant analysis, MANOVA, factor analysis, and binary logistic regression. The approach is applied and does not require formal mathematics; equations are accompanied by verbal explanations. Students are asked to

think about the meaning of equations Each chapter presents a complete empirical research example to illustrate the application of a specific method Although SPSS examples are used throughout the book the conceptual material will be helpful for users of different programs Each chapter has a glossary and comprehension questions
