CFD Applications in Nuclear Engineering Wenxi Tian,Victor Petrov,Yixiang Liao,Mingjun Wang,Nejdet Erkan,2023-08-21 High fidelity nuclear reactor thermal hydraulic simulations are a hot research topic in the development of nuclear engineering technology The three dimensional Computational Fluid Dynamics CFD and Computational Multi phase Fluid Dynamics CMFD methods have attracted significant attention in predicting single phase and multi phase flows under steady state or transient scenarios in the field of nuclear reactor engineering Compared with three dimensional thermal hydraulic methods the traditional one dimensional system analysis method contains inherent defects in the required accuracy and spatial resolution for a number of important nuclear reactor thermal hydraulic phenomena At present the CFD method has been widely adopted in the nuclear industry across both light water reactors and liquid metal cooled fast reactors providing an effective solution for complex issues of thermal hydraulic analysis However the CFD method employs empirical models for turbulence simulation heat transfer multi phase interaction and chemical reactions Such models must be validated before they can be used with confidence in nuclear reactor applications In addition

user practice guidelines play a critical role in achieving reliable results from CFD simulations *Matlab - Modelling, Programming and Simulations* Emilson Pereira Leite, 2010 Comfort Control in Buildings María del Mar Castilla, José Domingo Álvarez, Francisco Rodríguez, Manuel Berenguel, 2014-06-30

The aim of this book is to research comfort control inside buildings and how this can be achieved through low energy consumption. It presents a comprehensive exploration of the design development and implementation of several advanced control systems that maintain users' comfort, thermal and indoor air quality whilst minimizing energy consumption. The book includes a detailed account of the latest cutting edge developments in this area and presents several control systems based on Model Predictive Control approaches. Real life examples are provided and the book is supplemented by illustrations, tables all of which facilitate understanding of the text.

Energy consumption in buildings, residential and non residential, represents almost the half of the total world energy consumption and they are also responsible for approximately 35% of CO₂ emissions. For these reasons, the reduction of energy consumption associated with the construction and use of buildings and the increase of energy efficiency in their climatic refurbishment are frequently studied topics in academia and industry. As the productivity of users is directly related to their comfort, a middle ground needs to be found between comfort of users and energy efficiency. In order to achieve this, it is necessary to develop innovation and technology which can provide comfortable environments with minimum energy consumption. This book is intended for researchers interested in control engineering, energy and bioclimatic buildings and for architects and process control engineers. It is also accessible to postgraduate students embarking on a career in this area, particularly those studying architecture.
