Navarro, Victor Yepes, Jose V. Mart, Given the great impacts associated with the construction and maintenance of

infrastructures in both the environmental the economic and the social dimensions a sustainable approach to their design appears essential to ease the fulfilment of the Sustainable Development Goals set by the United Nations Multicriteria decision making methods are usually applied to address the complex and often conflicting criteria that characterise sustainability e present study aims to review the current state of the art regarding the application of such techniques in the sustainability assessment of infrastructures analysing as well the sustainability impacts and criteria included in the assessments Analytic Hierarchy Process is the most frequently used weighting technique Simple Additive Weighting has turned out to be the most applied decision making method to assess the weighted criteria Although a life cycle assessment approach is recurrently used to evaluate sustainability standardised concepts such as cost discounting or presentation of the assumed functional unit or system boundaries as required by ISO 14040 are still only marginally used Additionally a need for further research in the inclusion of fuzziness in the handling of linguistic variables is identified

Key sections explore the principles of sustainable design, covering energy efficiency, life cycle thinking, waste reduction, and improved quality of life through infrastructure. It examines pressing environmental concerns like climate change and biodiversity loss alongside ecological strategies such as biomimicry. The text delves into sustainable construction materials, Life Cycle Assessment (LCA), and circular economy principles, including reuse, recycling, and design for disassembly. It also covers energy-efficient buildings, smart city planning, and low-impact construction. Final chapters focus on performance measurement, Environmental Impact Assessments (EIAs), water management, and emerging technologies like AI and IoT, offering a forward-thinking outlook on sustainable civil engineering.

Planning Sustainable Cities Spiro N. Pollalis, 2016-05-20

Planning Sustainable Cities is an infrastructure-based approach that provides an analytical framework for urban sustainability, focusing on the services and performance of infrastructure systems. The book approaches infrastructure as a series of systems that function in synergy and are directly linked with urban planning. This method streamlines and guides the planning process while still highlighting detail; each infrastructure system is decoded in four system levels. The levels organize the processes, highlight connections between entities, and decode the high-level planning and decision-making process affecting infrastructure. For each system level, strategic objectives of planning are determined. The objectives correspond to the five focus areas of the Zofnass program: Quality of life, Natural World, Climate, and Risk Resource Allocation Leadership. Developed through the Zofnass Program at the Harvard Graduate School of Design, this approach integrates the key infrastructure systems of Energy, Landscape, Transportation, Waste Water, Information, and Food and explores their synergies through land use planning, engineering, economics, and policy. The size and complexity of infrastructure systems means that multiple stakeholders facing their own challenges and agendas are involved in planning; this book creates a common collaborative platform between public authorities, planners, and engineers. It is an essential
