

GOUT AND OTHER CRYSTAL ARTHROPATHIES IN CANADA

HIGHLIGHTS FROM THE CANADIAN CHRONIC DISEASE SURVEILLANCE SYSTEM

Arthropathies are a general term referring to diseases of the joints. Gout is a form of crystal arthropathies, characterized by the changes in uric acid levels which lead to joint swelling and sometimes, joint damage. The reported prevalence and incidence of gout are increasing worldwide and it is considered to be the most common type of inflammatory arthritis.^{1,2} Symptoms of gout and other types of crystal arthropathies, including pseudogout, are often treated with medication, but lifestyle changes may also help.³

The Public Health Agency of Canada (PHAC), in collaboration with all Canadian provinces and territories, conducts national surveillance of gout and other crystal arthropathies to support public health action. This fact sheet presents an overview of diagnosed gout and other crystal arthropathies data from the Canadian Chronic Disease Surveillance System (CCDSS). For further information, refer to **WHAT'S IN THE DATA?**

WHAT ARE GOUT AND OTHER CRYSTAL ARTHROPATHIES?

Gout and pseudogout are the two most common types of crystal arthropathies, caused by small crystals that accumulate in the joints.⁴ Gout is characterized by the crystallization of uric acid within the joints and is often associated with the excess of uric acid in the blood.

Hyperuricemia, while pseudogout results from deposits of calcium pyrophosphate crystals in the joints. The body's immune system is triggered by these crystals, and the immune system activity can lead to pain, swelling and redness in the joint and surrounding tissues. While gout can occur in any joint, it often occurs at the base of the big toe.⁵ Other joints commonly involved include the knees, ankles, elbows, wrists and fingers. Both gout and pseudogout are episodic in nature with active and inactive periods. Active periods or "attacks" vary in length and severity, although it is common that pseudogout episodes are less intense than gout. Repeated attacks of these conditions may become more frequent, last longer and affect more joints, and can cause permanent joint damage.

HOW MANY CANADIANS LIVE WITH GOUT AND OTHER CRYSTAL ARTHROPATHIES (PREVALENCE) AND HOW MANY ARE NEWLY DIAGNOSED EACH YEAR (INCIDENCE)?

Approximately 481,000 (2.4%) Canadians aged 20 years and older had been diagnosed with gout and other crystal arthropathies and 54,000 (1.9 per 1,000 persons per year) were newly diagnosed in 2015-2017. The prevalence and incidence of diagnosed gout and other crystal arthropathies generally increase with age and are higher among males (3.7% and 2.8 per 1,000 persons per year, respectively) compared to females (1.1% and 1.0 per 1,000 persons per year, respectively) (Figures 1 and 2).
