Cementitious Materials for Nuclear Waste Immobilization Rehab O. Abdel Rahman, Ravil Z. Rakhimov, Nailia R. Rakhimova, Michael I. Ojovan, 2014-08-28 Cementitious materials are an essential part in any radioactive waste disposal facility Conditioning processes such as cementation are used to convert waste into a stable solid form that is insoluble and will prevent dispersion to the surrounding environment It is incredibly important to understand the long term behavior of these materials This book summarises approaches and current practices in use of cementitious materials for nuclear waste immobilisation It gives a

unique description of the most important aspects of cements as nuclear waste forms starting with a description of wastes analyzing the cementitious systems used for immobilization and describing the technologies used and ending with analysis of cementitious waste forms and their long term behavior in an envisaged disposal environment Extensive research has been devoted to study the feasibility of using cement or cement based materials in immobilizing and solidifying different radioactive wastes However these research results are scattered This work provides the reader with both the science and technology of the immobilization process and the cementitious materials used to immobilize nuclear waste It summarizes current knowledge in the field and highlights important areas that need more investigation The chapters include Introduction Portland cement Alternative cements Cement characterization and testing Radioactive waste cementation Waste cementation technology Cementitious wasteform durability and performance assessment

Saslow,Hye-Ryun Cho,Taishi Kobayashi,Bernd Grambow,2023-12-13 Safety concepts regarding nuclear waste disposal in underground repositories generally rely on a combination of engineered and geological barriers that minimize potential radionuclide release out of the containment providing rock zone and transport through the biosphere The presence of water however may alter the engineered barrier system dissolve radionuclides and facilitate radionuclide transport that over time may permeate the biosphere So while barrier systems aim to prevent or hinder water from contacting the waste the possible intrusion of aqueous solutions must be considered for several safety case scenarios impacted by the long term evolution of a repository Dissolution and solubility phenomena thus arise as important processes controlling the chemical behaviour of radionuclides and other key materials of relevance in the context of such repositories and their safety assessments The solubility and aqueous speciation of radionuclides is of particular interest as they provide upper limits of water transportable concentrations of radionuclides Solubility phenomena of radioactive and other gases in water provide important information

on gas transport and pressure build up Moreover solubility assessments offer insight into time independent constraints on the evolution of the disposal system Particularly important in this regard is the geochemical modelling of radionuclide behaviour in the engineered barrier system as well as in natural aquatic systems along the transport path of radionuclides to the biosphere The obtained information provides valuable inputs that appropriately constrain safety analyses of nuclear waste disposal
