Recovery EOR evaluations focused on asset acquisition or rejuvenation involve a combination of complex decisions using
different data sources EOR projects have been traditionally associated with high CAPEX and OPEX as well as high financial
risk which tend to limit the number of EOR projects launched In this book the authors propose workflows for EOR
evaluations that account for different volumes and quality of information This flexible workflow has been successfully applied
to oil property evaluations and EOR feasibility studies in many oil reservoirs The methodology associated with the workflow
relies on traditional look up tables XY correlations etc and more advanced data mining for analog reservoir search and
geology indicators screening methods emphasizing identification of analogues to support decision making The screening
phase is combined with analytical or simplified numerical simulations to estimate full field performance by using reservoir
data driven segmentation procedures Case Studies from Asia Canada Mexico South America and the United States Assets
evaluated include reservoir types ranging from oil sands to condensate reservoirs Different stages of development and
information availability are discussed **Annual Report of the President of the University on Behalf of the Regents
