Statistical Association Regression analysis is a conceptually simple method for investigating relationships among variables. Carrying out a successful application of regression analysis however requires a balance of theoretical results, empirical rules, and subjective judgment. Regression Analysis by Example Fifth Edition has been expanded and thoroughly updated to reflect recent advances in the field. The emphasis continues to be on exploratory data analysis rather than statistical theory. The book offers in depth treatment of regression diagnostics, transformation, multicollinearity, logistic regression, and robust regression. The book now includes a new chapter on the detection and correction of multicollinearity while also showcasing the use of the discussed methods on newly added data sets from the fields of engineering, medicine, and business. The Fifth Edition also explores additional topics including Surrogate ridge regression, Fitting nonlinear models, Errors in variables, ANOVA for designed experiments. Methods of regression analysis are clearly demonstrated and examples containing the types of irregularities commonly encountered in the real world are provided. Each example isolates one or two techniques and features detailed discussions, the required assumptions, and the evaluated success of each technique. Additionally, methods described throughout the book can be carried out with most of the currently available statistical software packages such as the software package R. Regression Analysis by Example Fifth Edition is suitable for anyone with an understanding of elementary statistics.

Loss Models: From Data to Decisions, Book + Solutions Manual Set Stuart A. Klugman, 2019-05-21. A modern practical guide to building and using actuarial models. Loss Models: From Data to Decisions is organized around the principle that actuaries build models in order to analyze risks and make decisions about managing the risks based on conclusions drawn from the analysis. In practice, one begins with data and ends with a business decision. The book flows logically from this principle. It begins with a framework for model building and a description of frequency and severity loss data typically available to actuaries. Parametric models are emphasized throughout. The frequency and severity models are used in building aggregate loss models, in credibility based pricing models, and in loss analysis over multiple time periods. Designed as both an educational text as well as a professional reference. Loss Models Assumes little prior knowledge of insurance systems. Features many fascinating examples taken from insurance files. Contains a major instructive case study continued through each chapter. Covers the classical areas of risk theory and loss distributions. Gives a practical but rigorous treatment of modern credibility theory. Uses standard statistical concepts, methods, and notation. Provides modern computational algorithms for implementing methods. Includes free companion software available from an FTP site. Deals with many topics on CAS 4B and SOA 151 and 152 actuarial exams. Includes many exercises based on past CAS and SOA exams.
